

1. Centrifuge the light blue tube.

2. Carefully remove the tube from the centrifuge to not disturb the cells.  
3. Use a pipette to remove the plasma from the top.

4. Transfer the plasma into a clear, transport tube and centrifuge the transport tube.

5. Carefully remove the tube from the centrifuge. There should be a small button of cells at the bottom.

6. Remove the plasma and transfer into the final transport tube.

7. Label this tube with "citrate plasma. Cap with a white cap.

8. Freeze immediately or within 4 hours.
