

**UNITYPOINT HEALTH - MERITER LABORATORIES**  
**TEST ANNOUNCEMENT**

**Staphylococcus saprophyticus Susceptibility and Urine Culture Final Results**

**2/10/2026**

---

Beginning February 23, to align with current CLSI guidelines, Microbiology will no longer be routinely reporting susceptibilities on *Staphylococcus saprophyticus* in urine cultures. The following comment will be appended to the result: **CLSI does not recommend routine susceptibility testing of *Staphylococcus saprophyticus* urine isolates. These infections respond to concentrations achieved in urine of antimicrobial agents commonly used to treat acute, uncomplicated urinary tract infections (Nitrofurantoin, Trimethoprim +/- Sulfamethoxazole, or a Fluoroquinolone).**

Additionally, non-invasively collected urine cultures with **no growth** or **mixed skin microbiota** will have a final result at 18 hours. Invasively collected urine will still be held for 48 hours.
