

Urine Specimen Collection

1 Remove the sticker from the top of the specimen cup. When removing, be careful to not touch the top of lid.

2 Carefully flip up the straw spout. Pay special attention to not touch top of spout.

3 Place the collection straw through the spout, touching only the top section of the straw. **Note: the straw will not reach the bottom of cup.**

4 If **less** than ~45mL of urine is present, remove lid, place straw directly in urine.

5 Continue by filling the tubes using the CPR order.
