

MULTIPLE ALLERGEN SPECIMEN COLLECTION INSTRUCTIONS

Allergen analysis is performed on an automated platform that requires significant volume. Multiple allergen determinations can be made from a single tube.

Specimen Requirements:

- Collect serum in a serum separator tube (SST)
- Centrifuge after clotting or within two hours collection
- Send the specimen at refrigerated temperature

Specimen Volume

Number of allergens to be tested	Preferred total serum volume	Number of full SST tubes
2-30	2.0mL	1 full tube
31-70	4.0mL	2 full tubes
71-100	6.0mL	3 full tubes
Greater than 100	Call Lab	

On average, from one full tube you may obtain 2 to 2.5mL of serum.

NOTE* A higher hematocrit will result in lower serum.

WARNING: Send separate specimens for nonallergen testing
