

## TriHealth Laboratories

### REFLEX TESTING

Reflex testing is an important tool in providing timely, cost-effective and quality care to patients. A reflex test is a laboratory test performed (and charged for) subsequent to an initially ordered and resulted test. Reflex testing occurs when an initial test result meets pre-determined criteria (e.g., positive or outside normal parameters), and the primary test result is inconclusive without the reflex or follow-up test. It is performed automatically without the intervention of the ordering physician. Reflex testing may prevent the need for additional specimen procurement from the patient.

The reflex test adds valuable diagnostic information and is consistent with best medical practices. Certain confirmatory reflex tests are required by law; but generally each laboratory establishes its own criteria for medically appropriate reflex tests. A laboratory must disclose to the ordering physician its protocol for performing reflex testing and provide the physician with the opportunity to decline the follow-up tests.

The following chart contains the criteria used for reflex testing at TriHealth Laboratories. Shaded blocks indicate those tests that are performed by a referral laboratory. This information is provided in the Lab User Manual, available on the Bridge for in-house practitioners, and also on the TriHealth Laboratories Test Menu website for outreach clients. Upon major revision, this reflex testing protocol is presented to the Laboratory Utilization and Practice Committee (LUPC) for medical staff approval.

**If a physician does not want a reflex test performed according to the protocol established by TriHealth Laboratories, he/she must indicate such at the time the initial test is ordered.**
