Celiac Disease *HLA-DQ* Genotyping

LAB6354

ORDERING INFO

Collect:
Lavender (EDTA). Also acceptable: Yellow (ACD solution A).

Synonyms:

- Celiac Disease genotyping
- DQ2
- DQ8
- HLA Celiac Disease Testing
- HLA DQ
- HLA genotyping for Celiac Disease
- HLA-DQ2
- HLA-DQ2.2
- HLA-DQ2.5
- HLA-DQ8
- HLA-DQA1*05, HLA-DQB1*02, and *03:02
- LAB6354-VML
- LAB6354VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA). Also acceptable: Yellow (ACD solution A).

Specimen Preparation:
Transport 3 mL whole blood. (Min: 1 mL)

Unacceptable Conditions:
Specimens collected in yellow (ACD solution B). Clotted, grossly hemolyzed, or heparinized specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: Unacceptable

Performed:
Mon-Fri

ORDERING

Synonyms:

- Celiac Disease genotyping
- DQ2
- DQ8
- HLA Celiac Disease Testing
- HLA DQ
- HLA genotyping for Celiac Disease
- HLA-DQ2
- HLA-DQ2.2
- HLA-DQ2.5
- HLA-DQ8
- HLA-DQA1*05, HLA-DQB1*02, and *03:02
- LAB6354-VML
- LAB6354VML

Ordering Recommendations:
Not recommended for use in the initial evaluation of celiac disease. May be useful to rule out celiac disease in selective clinical situations (eg, when a patient has started a gluten-free diet prior to testing or when small bowel histologic findings are equivocal) or to identify risk (eg, in individuals who have first-degree family members with celiac disease). For more information, refer to the Celiac Disease HLA-DQ Genotyping Test Fact Sheet.

Performed:
Mon-Fri

Methodology:
Polymerase Chain Reaction/Massively Parallel Sequencing/Sequence-Specific Oligonucleotide Probe Hybridization

Reported:
8-15 days

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Background Information for Celiac Disease HLA-DQ Genotyping:
Characteristics: Celiac disease is a systemic autoimmune disease of the gastrointestinal system caused by exposure to cereal gluten in genetically susceptible individuals.
Incidence: On average, 1 in 133 individuals in the United States is affected.
Inheritance: Multifactorial.
Cause: The presence of either HLA-DQ2 or the HLA-DQ8 alleles in combination with dietary gluten.
Clinical Sensitivity: greater than 99 percent.
Methodology: Polymerase Chain Reaction/Massively Parallel Sequencing, or Polymerase Chain Reaction/Sequence-Specific Oligonucleotide Probe Hybridization.
Analytical Sensitivity and Specificity: greater than 99 percent.
Limitations: Rare diagnostic errors may occur due to primer site mutations. Other genetic and nongenetic factors that influence celiac disease are not evaluated. In cases where an HLA allele cannot be resolved unambiguously, the allele assignment will be reported as the most common, based on allele frequencies from the common, intermediate and well-documented alleles catalogue version 3.0.0 (Hurley CK, et al, 2020).
Alleles tested: HLA-DQA1 and HLA-DQB1 alleles.
Most celiac disease patients (approximately 90 percent) carry HLA-DQ2.5 heterodimers encoded by HLA-DQA1*05 and HLA-DQB1*02 alleles. The remaining 5-10 percent of the patients carry HLA-DQ8, encoded by HLA-DQB1*03:02 allele, most commonly in combination with HLA-DQA1*03 alleles. A minority of patients negative for the above genotypes may carry HLA-DQB1*02 but without the DQA1*05 alpha chain, most commonly with DQA1*02. The presence of the DQB1*02 allele in combination with either DQ2.5 or DQ8 may further increase celiac disease risk.

Stratified overall genetic risk for patients carrying the celiac disease-associated HLA-DQ genotypes:

Genotype	Risk**
DQ2.5 homozygous	Very high (greater than 1:10)
DQ2.5 + DQB1*02	Very high (greater than 1:10)
DQ2.5 + DQ8	High (greater than 1:20)
DQ8 homozygous	High (greater than 1:20)
DQ8 + DQB1*02 (without DQA1*05)	Intermediate (greater than 1:50)
DQ2.5 heterozygous	Intermediate (greater than 1:50)
DQ8 heterozygous	At risk (greater than 1:100)
Population risk for unknown genotype	1:100
DQB1*02 (without DQA1*05)	Low
DQA1*05 (without DQB1*02)	Minimal
Negative for DQ2 and DQ8	Not at risk

**Risk is provided from the references below, and defined according to HLA allele combinations, considering a disease prevalence of 1:100. However, these alleles are common in the general population and the majority of individuals positive for celiac-associated alleles do not develop the disease. Detection of these alleles can support a clinical diagnosis but should not be interpreted as diagnostic of celiac disease.

Disclaimer Information:
This test was developed and its performance characteristics determined by the Histocompatibility & Immunogenetics Laboratory at the University of Utah Health. It has not been cleared or approved by the U.S. Food and Drug Administration (FDA). The FDA has determined that such clearance or approval is not necessary. This test is used for clinical purposes. It should not be regarded as investigational or for research. The Histocompatibility & Immunogenetics Laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA-88) as qualified to perform high complexity clinical laboratory testing.
Performed at: Histocompatibility & Immunogenetics Laboratory, University of Utah Health, 417 Wakara Way, Suite 3220, Salt Lake City, UT 84108.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Celiac Panel with reflex EMA, serum or plasma

LAB821

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB821, CPE
- LAB821-VML
- LAB821VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 1.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
Evaluating patients suspected of having celiac disease, including patients with compatible symptoms, patients with atypical symptoms, and individuals at increased risk (family history, previous diagnosis with associated disease)

Synonyms:

- LAB821, CPE
- LAB821-VML
- LAB821VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
Deamidated Gliadin IgG, Deamidated Gliadin IgA, Tissue Transglutaminase IgG Ab, Tissue Transglutaminase IgA

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The recommended screening test for celiac disease is tissue transglutaminase IgA (tTG IgA) . Tissue transglutaminase IgG (tTG IgG) and deamidated gliadin IgG should only be used for diagnosis when a patient has a total IgA deficiency. The IgG-based tests have a lower specificity and therefore a lower positive predictive value. If the patient has a positive serology and celiac disease is likely, consider consulting the VUMC adult celiac gastroenterology clinic or pediatric gastroenterology clinic to discuss diagnosis further. Patients should continue to consume gluten until seen in the clinic.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Additional Information:
If the quantitative IgA is >5 and the tTG IgA is positive, there is an automatic reflex to ARUP test EMA IgA; If the quantitative IgA is <5 and the tTG IgG is positive, there is an automatic reflex to ARUP test EMA IgG.

Components:
Deamidated Gliadin IgG, Deamidated Gliadin IgA, Tissue Transglutaminase IgG Ab, Tissue Transglutaminase IgA

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:

Centromere Antibody, IgG

LAB3715

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- ACA
- Anti-centromere Antibodies
- Anti-Centromere Antibody
- Centromere Autoantibodies
- Centromere B
- CREST
- Anticentromere Antibodies
- Centromere Antibodies, IgG
- CENTROMERE ANTIBODY
- HEp-2
- LAB3715-VML
- LAB3715VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL)

Unacceptable Conditions:
Plasma. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- ACA
- Anti-centromere Antibodies
- Anti-Centromere Antibody
- Centromere Autoantibodies
- Centromere B
- CREST
- Anticentromere Antibodies
- Centromere Antibodies, IgG
- CENTROMERE ANTIBODY
- HEp-2
- LAB3715-VML
- LAB3715VML

Ordering Recommendations:
Aid in diagnosis of systemic sclerosis (SSc). Negative results do not rule out SSc. Preferred test is Comprehensive Systemic Sclerosis Panel (3000480).

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Multiplex Bead Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Centromere Ab, IgG	0-40 AU/mL

Interpretive Data:

When detected by this multiplex bead assay, the presence of centromere antibodies is mainly associated with CREST syndrome, a variant of systemic sclerosis (SSc). These antibodies target the centromere B, a dominant antigen of the centromeric complex associated with the centromere pattern observed in antinuclear antibody (ANA) testing by IFA. Centromere antibodies may also be seen in a varying percentage of patients with other autoimmune diseases, including diffuse cutaneous SSc, Raynaud syndrome, interstitial pulmonary fibrosis, autoimmune liver disease, systemic lupus erythematosus (SLE) and rheumatoid arthritis (RA).

A negative result indicates no detectable IgG antibodies to centromere B. If the result is negative but clinical suspicion for SSc is strong, consider testing for ANA by IFA along with other antibodies associated with SSc, including Scl-70, U3-RNP, PM/Scl, or Th/To.

Component	Interpretation
Centromere Antibody, IgG	29 AU/mL or less Negative 30-40 AU/mL Equivocal 41 AU/mL or greater Positive

Chlamydia trachomatis and Neisseria gonorrhoeae (CT/NG) Detection by PCR

LAB1364

ORDERING INFO

Collect:
Swabs: Yellow top cobas® Female Swab Sample Kit, Urine: Yellow top cobas® PCR Urine Sample kit. Cervical Sample: Preservcyt ThinPrep media.

Synonyms:

- LAB1364, Chlamydia, Gonorrhea, CTNG, CT/NG, CGD, CT NG PCR
- LAB1364-VML
- LAB1364VML

Turn Around Time:
1-3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Swabs: Yellow top cobas® Female Swab Sample Kit, Urine: Yellow top cobas® PCR Urine Sample kit. Cervical Sample: Preservcyt ThinPrep media.

Specimen Preparation:
Urine: Send neat urine in a sterile container or filled completely to the indicator box using the cobas Urine Collection Kit. Swab: Collect a single swab from the Swab Sample Kit and snap off in the yellow top cobas® PCR media. (Min 0.6mL Urine)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Urine (neat): Refrigerated (2-8°C). Swabs or Urine collected in cobas Collection Kit: Ambient (15-25°C) if same day, Refrigerated (2-8°C) if overnight or up to 7 days. ThinPrep: Ambient (15-25°C)

Performed:
Monday - Friday

Stability:
Urine (Neat): Up to 24 hours at Ambient (15-25°C), 3 days at Refrigerated (2-8°C) . Urine or Swabs collected in cobas Collection Kits: 7 days at Ambient (15-25°C), Cervical ThinPrep specimens: 4 weeks at Ambient (15-25°C)

Specimen:
Urine (male or female), Rectal Swabs, Oropharyngeal Swabs, Vaginal Swabs, Endocervical Swabs (can be collected in Cobas Media or Preservcyt ThinPrep)

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
C. trachomatis (CT) and Neisseria gonorrhoeae (NG) infections are the two most common communicable notifiable diseases in the United States. CT causes cervicitis, urethritis, salpingitis, proctitis, and endometritis in women and urethritis, epididymitis, and proctitis in men. CT can also be transmitted via the birth canal, potentially resulting in infant conjunctivitis and/or chlamydial pneumonia in newborns. NG causes acute urethritis in males, which if untreated can develop into epididymitis, prostatitis, and urethral stricture. In females, the primary site of NG infection is the endocervix. An important complication in females is development of pelvic inflammatory disease, which contributes to infertility. Asymptomatic NG infections occur often in females but infrequently in males. Current methods for detection of CT and/or NG include culture, immunoassays, non-amplified probes, and nucleic acid amplification tests (NAATs). NAATs have demonstrated two advantages over non-amplified methods: increased sensitivity and applicability to a variety of sample types, including urine. NAATs have been accepted as the preferred method for laboratory diagnosis of CT and NG infections. In addition to testing for genital CT and NG infections, CDC recommendations reflect the clinical utility of NAA-based CT and NG testing of rectal and oropharyngeal specimens collected from patients at increased risk of infection at these extragenital sites, in particular, men who have sex with men.

Synonyms:

- LAB1364, Chlamydia, Gonorrhea, CTNG, CT/NG, CGD, CT NG PCR
- LAB1364-VML
- LAB1364VML

Performed:
Monday - Friday

Turn Around Time:
1-3 days

Methodology:
PCR - Polymerase Chain Reaction

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This test is intended for medical purposes only and is not valid for the evaluation of suspected sexual abuse or for other forensic purposes. In certain contexts, culture may be required to meet applicable laws and regulations for diagnosis of C. trachomatis and N. gonorrhoeae infections. Per CDC recommendations, this test does not include confirmation of positive results by an alternative nucleic acid target.

Methodology:
PCR - Polymerase Chain Reaction

Cholinesterase, RBC - Ratio to Hemoglobin

LAB966

ORDERING INFO

Collect:
Lavender (EDTA) or pink (K2EDTA).

Synonyms:

- AChE
- CHS
- RBC Cholinesterase
- Red cell cholinesterase
- LAB966-VML
- LAB966VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or pink (K2EDTA).

Specimen Preparation:
DO NOT FREEZE. Transport 3 mL whole blood. (Min: 1 mL)

Unacceptable Conditions:
Green (sodium or lithium heparin). Frozen specimens. Clotted or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated. Do not place whole blood directly on cool packs when shipping.

Stability (from collection to initiation):
Ambient: 4 hours; Refrigerated: 1 week; Frozen: Unacceptable

Performed:
Mon-Fri

ORDERING

Chromium, Serum

LAB967

ORDERING INFO

Collect:
Royal Blue (No Additive).

Synonyms:

- Cr, Blood
- CRS
- serum chromium levels
- serum metal ion concentration
- LAB967-VML
- LAB967VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician).

Collect:
Royal Blue (No Additive).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Trace Element-Free Transport Tube (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Royal Blue (EDTA) or separator tubes. Specimens that are not separated from the clot within 2 hours. Specimens transported in tubes other than specified.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated or frozen.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Indefinitely

Performed:
Sun-Sat

ORDERING

Synonyms:

- Cr, Blood
- CRS
- serum chromium levels
- serum metal ion concentration
- LAB967-VML
- LAB967VML

Ordering Recommendations:
May be useful in the assessment of chromium deficiency or overload. For the assessment of hexavalent chromium exposure, Chromium, RBC (2014505) is preferred.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 5.0 µg/L

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of serum chromium, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Serum chromium levels can be significantly higher in patients with metal-on-metal total hip replacement implants than in control patients without metal implants. Serum chromium levels may be increased in asymptomatic patients with metal-on-metal prosthetics and should be considered in the context of the overall clinical scenario. Whole blood is the specimen type recommended by the U.S. Food and Drug Administration for assessing the risks of metal-on-metal hip implants in symptomatic patients.

Symptoms associated with chromium toxicity vary based on route of exposure and dose, and may include dermatitis, impairment of pulmonary function, gastroenteritis, hepatic necrosis, bleeding, and acute tubular necrosis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Chromium, Urine

LAB4077

ORDERING INFO

Collect:
24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Synonyms:

- Cr
- CRU
- Urine chromium concentration
- LAB4077-VML
- LAB4077VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician). High concentrations of iodine may interfere with elemental testing. Collection of urine specimens from patients receiving iodinated or gadolinium-based contrast media should be avoided for a minimum of 72 hours post-exposure. Collections from patients with impaired kidney function should be avoided for a minimum of 14 days post contrast media exposure.

Collect:
24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Specimen Preparation:
Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL)

Unacceptable Conditions:
Urine collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Acid preserved urine. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element-free transport tube (with the exception of the original device).

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

Remarks:
Record total volume and collection time interval on transport tube and on test request form.

Creatinine, Urine - per 24h	<table><tr><th>Age</th><th>Male (mg/d)</th><th>Female (mg/d)</th></tr><tr><td>3-8 years</td><td>140-700</td><td>140-700</td></tr><tr><td>9-12 years</td><td>300-1300</td><td>300-1300</td></tr><tr><td>13-17 years</td><td>500-2300</td><td>400-1600</td></tr><tr><td>18-50 years</td><td>1000-2500</td><td>700-1600</td></tr><tr><td>51-80 years</td><td>800-2100</td><td>500-1400</td></tr><tr><td>81 years and older</td><td>600-2000</td><td>400-1300</td></tr></table>
Chromium, Urine - per 24h	0.0-2.0 µg/d
Chromium, Urine - ratio to CRT	0.0-10.0 µg/g CRT
Chromium, Urine - per volume	0.0-2.0 µg/L

Interpretive Data:

Chromium urine levels can be used to monitor short term exposure. The form of chromium greatly influences distribution. Trivalent chromium resides in the plasma and is usually not of clinical importance. Hexavalent chromium is considered highly toxic. Symptoms associated with chromium toxicity vary based upon route of exposure and dose and may include dermatitis, impairment of pulmonary function, gastroenteritis, hepatic necrosis, bleeding, and acute tubular necrosis.

The ACGIH Biological Exposure Index for daily exposure of hexavalent chromium is an increase of 10 µg/gCRT between pre-shift and post-shift urine collections. The ACGIH Biological Exposure Index for long- and short-term hexavalent chromium is an end-of-shift concentration of 30 µg/gCRT at the end of the work week.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative Inductively Coupled Plasma-Mass Spectrometry

ADDITIONAL INFORMATION

RF-ARUP

Remarks:

Record total volume and collection time interval on transport tube and on test request form.

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Specimen Preparation:

Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL)

Patient Preparation:

Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician). High concentrations of iodine may interfere with elemental testing. Collection of urine specimens from patients receiving iodinated or gadolinium-based contrast media should be avoided for a minimum of 72 hours post-exposure. Collections from patients with impaired kidney function should be avoided for a minimum of 14 days post contrast media exposure.

Unacceptable Conditions:

Urine collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Acid preserved urine. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element-free transport tube (with the exception of the original device).

Stability (from collection to initiation):

Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated. Also acceptable: Room temperature or frozen.

Chromogenic Factor VIII Activiy

LAB6350

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB6350, N/A
- LAB6350-VML
- LAB6350VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Inpatients and VPLS clients: daily. Outpatients: once per week; variable days.

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma - Requires double centrifugation if sending a plasma aliquot. Aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Alternate Specimen:

- LAB6157VML
- Chromogranin

Ordering Recommendations:
Aids in monitoring but is not recommended for diagnosis of carcinoid tumors. May be useful in monitoring nonsecretory sympathetic and parasympathetic neuroendocrine tumors.

Performed:
Sun-Sat

Methodology:
Immunofluorescence

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
0-187 ng/mL

Interpretive Data:

This test is performed using the BRAHMS CGA II Kryptor kit. Results obtained with different methods or kits cannot be used interchangeably. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease and should be evaluated in combination with clinical symptoms, diagnostic evidence, and/or other laboratory parameters. The change ofCgA concentration over time provides diagnostic information whether a tumor progression has occurred.

An increase of CgA serum concentrations of more than 50% to avalue of greater than 100 ng/ml between consecutive monitoring visits defines a positive test result, representing a higher probability that a tumor progression has occurred.

A change of CgA serum concentrations of equal or less than 50% increase between monitoring visits or to a value of 100 ng/ml or less defines a negative test result, representing a lower probability that a tumor progression has occurred. Nontumor related elevations of Chromogranin A can be observed in gastrointestinal, cardiovascular, and renal disorders, cancers other than neuroendocrine tumors, as well as with proton pump inhibitor (PPI) therapy. It is recommended to stop PPI treatment for at least 14 days prior to testing.

- LAB6157VML
- Chromogranin

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-4 days

Ordering Recommendations:

Aids in monitoring but is not recommended for diagnosis of carcinoid tumors. May be useful in monitoring nonsecretory sympathetic and parasympathetic neuroendocrine tumors.

Interpretive Data:

This test is performed using the BRAHMS CGA II Kryptor kit. Results obtained with different methods or kits cannot be used interchangeably. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease and should be evaluated in combination with clinical symptoms, diagnostic evidence, and/or other laboratory parameters. The change ofCgA concentration over time provides diagnostic information whether a tumor progression has occurred.

An increase of CgA serum concentrations of more than 50% to avalue of greater than 100 ng/ml between consecutive monitoring visits defines a positive test result, representing a higher probability that a tumor progression has occurred.

A change of CgA serum concentrations of equal or less than 50% increase between monitoring visits or to a value of 100 ng/ml or less defines a negative test result, representing a lower probability that a tumor progression has occurred. Nontumor related elevations of Chromogranin A can be observed in gastrointestinal, cardiovascular, and renal disorders, cancers other than neuroendocrine tumors, as well as with proton pump inhibitor (PPI) therapy. It is recommended to stop PPI treatment for at least 14 days prior to testing.

Reference Interval:

0-187 ng/mL

Circulating Immune Complex, C1q Binding

LAB3708

ORDERING INFO

Collect:
Plain red or serum separator tube (SST)

Synonyms:

- CIC
- Circulating complement binding immune complex
- Immune Complex Assay
- LAB3708-VML
- LAB3708VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube (SST)

Specimen Preparation:
Allow complete clotting of red blood cells (up to 1 hour), then separate serum from cells within 30 minutes and freeze immediately. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL) If ordered in conjunction with a Circulating Immune Complex, C3 fragments, transfer TWO (2) 1 mL aliquots of serum to individual ARUP Standard Transport Tubes.

Unacceptable Conditions:
Non-frozen specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 hours; Refrigerated: Unacceptable; Frozen: 2 weeks (avoid repeated freeze/thaw cycles)

Performed:
Mon, Thu, Sat

ORDERING

Synonyms:

- CIC
- Circulating complement binding immune complex
- Immune Complex Assay
- LAB3708-VML
- LAB3708VML

Ordering Recommendations:
Detect circulating immune complexes.

Performed:
Mon, Thu, Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
2-9 days

RESULTS INTERPRETATION

Reference Interval:
Effective February 19, 2019
Less than or equal to 3.9 µg Eq/mL

Interpretive Data:
Less than or equal to 3.9 µg Eq/mL is considered negative for circulating complement binding immune complexes. Circulating immune complexes may be found without any evident pathology and positive results do not necessarily implicate the immune complex in a disease process.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Citric Acid, Urine

LAB3230

ORDERING INFO

Collect:
24-hour urine. Refrigerate during collection. Also acceptable: Random urine.

Synonyms:

- Citrate
- Citric Acid, Random Urine
- Citric Acid, Urine
- Citric Acid/Creatinine Ratio, Random Urine
- Urinary Citrate Excretion
- LAB3230-VML
- LAB3230VML

SPECIMEN REQUIREMENTS

Collect:
24-hour urine. Refrigerate during collection. Also acceptable: Random urine.

Specimen Preparation:
Adjust pH to less than or equal to 2 by adding 6M HCl. Transfer a 4 mL aliquot of urine to an ARUP Standard Transport Tube. (Min: 0.5 mL) Record total volume, collection time interval, and pH on transport tube and test request form. Also acceptable: Specimens previously preserved with boric acid.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Citrate
- Citric Acid, Random Urine
- Citric Acid, Urine
- Citric Acid/Creatinine Ratio, Random Urine
- Urinary Citrate Excretion
- LAB3230-VML
- LAB3230VML

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Citric Acid, Urine - per 24h	18 years and older: 320-1240 mg/d
Citric Acid/Creatinine Ratio, Urine	1 year and older: greater than or equal to 150 mg/g.

Interpretive Data:
Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Clomipramine and Metabolite, Serum or Plasma (Test on Referral as of 03/05/24)

LAB3717

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Synonyms:

- Anafranil
- Norclomipramine
- Desmethylclomipramine
- LAB3717-VML
- LAB3717VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Predose (trough) draw at steady-state concentration.

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 5 days; Refrigerated: 2 weeks; Frozen: 6 months

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Anafranil
- Norclomipramine
- Desmethylclomipramine
- LAB3717-VML
- LAB3717VML

Ordering Recommendations:
Use to optimize dosing and monitor patient adherence.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:
Effective February 19, 2013

Therapeutic Range	Total (clomipramine and norclomipramine): 220-500 ng/mL
Toxic Level	Greater than 900 ng/mL

Interpretive Data:
The therapeutic range listed relates to the antidepressant characteristics of the drug. A therapeutic range for treating obsessive compulsive disorder is not well established. Toxic concentrations may cause anticholinergic effects, CNS depression, cardiac abnormalities, seizures, and hypotension.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

- Norclomipramine
- Desmethylclomipramine
- LAB3717-VML
- LAB3717VML

Performed:
Mon, Wed, Fri

Resulting Laboratory:
ARUP Laboratories

Reported:
1-7 days

Ordering Recommendations:
Use to optimize dosing and monitor patient adherence.

Interpretive Data:
The therapeutic range listed relates to the antidepressant characteristics of the drug. A therapeutic range for treating obsessive compulsive disorder is not well established. Toxic concentrations may cause anticholinergic effects, CNS depression, cardiac abnormalities, seizures, and hypotension.

Reference Interval:
Effective February 19, 2013

Therapeutic Range	Total (clomipramine and norclomipramine): 220-500 ng/mL
Toxic Level	Greater than 900 ng/mL

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Section:
RF-ARUP

CPT Codes:
80335 (Alt code: G0480)

Clonazepam

LAB466

ORDERING INFO

Collect:
Gray (potassium oxalate/sodium fluoride). Also acceptable: Plain red, green (sodium heparin), lavender (K2 or K3EDTA) or pink (K2EDTA).

Synonyms:

- Nitrozepane
- 340 Clonazepam
- Clonopin, S
- Klonopin
- Klonopin Wafers
- Nitrazepam
- Rivotril
- LAB466-VML
- LAB466VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Predose (trough) draw at steady state concentration

Collect:
Gray (potassium oxalate/sodium fluoride). Also acceptable: Plain red, green (sodium heparin), lavender (K2 or K3EDTA) or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 2 mL serum or plasma to an ARUP standard transport tube. (Min: 1 mL)

Unacceptable Conditions:
Gel separator tubes. Plasma or whole blood collected in light blue (sodium citrate). Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 3 years (Avoid repeated freeze/thaw cycles).

Performed:
Tue, Fri

ORDERING

Synonyms:

- Nitrozepane
- 340 Clonazepam
- Clonopin, S
- Klonopin
- Klonopin Wafers
- Nitrazepam
- Rivotril
- LAB466-VML
- LAB466VML

Ordering Recommendations:
Use to optimize dosing and monitor patient adherence.

Performed:
Tue, Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 18, 2013

Dose-Related Range	20-70 ng/mL - Dose (Adult) 1-8 mg/d
Toxic	Greater than 80 ng/mL

Interpretive Data:
Adverse effects may include drowsiness, headache, fatigue, and ataxia.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Clostridium difficile by PCR with Reflex to Toxin Detection

LAB5888

ORDERING INFO

Collect:
Sterile screwtop container

Synonyms:

- CDD, C. diff PCR, CDIFF
- LAB5888-VML
- LAB5888VML

Turn Around Time:
1 day

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Sterile screwtop container

Specimen Preparation:
(Min 0.5 mL)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Refrigerated: (2-8°C)

Performed:
Daily

Stability:
Ambient: (15-25°C) 48 hours; Refrigerated: (2-8°C) 5 days. Frozen, unacceptable

Specimen:
Stool, non-formed

Alternate Specimen:
Stool in Cary-Blair transport

ORDERING

Ordering Indicators:
Testing for C. difficile should be performed on patients with clinically significant diarrhea, defined as 3 or more loose stools per day. Repeat stool test for cure is NOT recommended.

Synonyms:

- CDD, C. diff PCR, CDIFF
- LAB5888-VML
- LAB5888VML

Performed:
Daily

Turn Around Time:
1 day

Methodology:
Real time PCR and immunochromagraphic method

Components:
Real-time PCR for C. difficile. If positive, reflex to immunochromatographic method for toxin detection.

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
Current guidelines recommend a multiple analyte algorithm for C. difficile testing which includes a nucleic acid amplification test performed with free toxin antigen detection. Please see below for interpretative data/clinical significance: 1. C. difficile PCR - Not Detected: No toxigenic C. difficile detected. 2. C. difficile PCR - Detected, C. difficile toxin antigen - Detected: These results are consistent with C. difficile infection in the context of the patient's clinical scenario. 3. C. difficile PCR - Detected, C. difficile toxin antigen - Not Detected: These results are suggestive of C. difficile colonization and may not reflect C. difficile infection requiring treatment. The significance of these results must be interpreted in the context of the patient's clinical scenario.

Methodology:
Real time PCR and immunochromagraphic method

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
Stool in Cary-Blair transport

Additional Information:
Positive C. difficile results will be reflexed to toxin assay.

Components:
Real-time PCR for C. difficile. If positive, reflex to immunochromatographic method for toxin detection.

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Clozapine and Metabolites, Serum or Plasma, Quantitative

LAB5768

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Synonyms:

- Clozaril
- Clopine
- Denzapine
- FazaClo
- Versacloz
- Zaponex
- LAB5768-VML
- LAB5768VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Predose(trough) draw - at steady -state concentration.

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube.(Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Clozaril
- Clopine
- Denzapine
- FazaClo
- Versacloz
- Zaponex
- LAB5768-VML
- LAB5768VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Therapeutic Range	Not well established
Toxic Level	Total Clozapine and Metabolites: Greater than or equal to 1500 ng/mL

Interpretive Data:
Therapeutic ranges are not well established. Clozapine is metabolized to norclozapine and clozapine-N-oxide. Clozapine concentrations between 100 and 700 ng/mL may correlate more with clinical response; however, nonresponsiveness may also occur within this range. For refractory schizophrenia, clozapine concentrations greater than 350 ng/mL are suggested to achieve a therapeutic response.

Toxicity: Adverse effects to clozapine therapy may include tachycardia, drowsiness, hypotension, and seizures.

Therapeutic and toxic ranges are not well established in children.

Cobalt, Blood

LAB3722

ORDERING INFO

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Synonyms:

- Blood cobalt concentration
- COB
- Co
- LAB3722-VML
- LAB3722VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician).

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Specimen Preparation:
Transport 6 mL whole blood in the original collection tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens collected in tubes other than Royal blue (K2EDTA) or Royal blue (NaHep). Clotted specimens.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- Blood cobalt concentration
- COB
- Co
- LAB3722-VML
- LAB3722VML

Ordering Recommendations:
May be used in the assessment of occupational exposure or toxic ingestion.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
0.5-3.9 µg/L

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of blood cobalt, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Blood cobalt levels can be used in the assessment of occupational exposure or toxic ingestion. Symptoms associated with cobalt toxicity vary based on route of exposure and may include cardiomyopathy, allergic dermatitis, pulmonary fibrosis, cough and dyspnea. Blood is the preferred specimen type for evaluating metal ion release from metal-on-metal joint arthroplasty.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Ordering Recommendations:
May be used in the assessment of occupational exposure or toxic ingestion.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 1.0 µg/L

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of serum/plasma cobalt, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Serum cobalt levels can be used in the assessment of occupational exposure or toxic ingestion. Symptoms associated with cobalt toxicity vary based on route of exposure, and may include cardiomyopathy, allergic dermatitis, pulmonary fibrosis, cough, and dyspnea.

Serum cobalt levels can be significantly higher in patients with metal-on-metal total hip replacement implants than in control patients without metal implants. Serum cobalt levels may be increased in asymptomatic patients with metal-on-metal prosthetics and should be considered in the context of the overall clinical scenario. Whole blood is the specimen type recommended by the U.S. Food and Drug Administration for assessing the risks of metal-on-metal hip implants in symptomatic patients.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 20 ng/mL

For medical purposes only; not valid for forensic use.

The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Methodology:

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

ADDITIONAL INFORMATION

CPT Codes:

80353 (Alt code: G0480)

Section:

RF-ARUP

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Gray (sodium fluoride/potassium oxalate). Also acceptable: Plain red, green (sodium heparin), lavender (EDTA), or pink (K2EDTA).

Specimen Preparation:

Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:

Separator tubes. Plasma or whole blood collected in lt. blue (sodium citrate). Specimens exposed to repeated freeze/thaw cycles. Hemolyzed specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 3 years

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- Benzoylecgonine
- Cocaethylene
- Benzoylmethylecgonine
- Cocaine
- Crack
- Pain Management
- M-OH Benzoylecgonine
- LAB968-VML
- LAB968VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-6 days

Ordering Recommendations:

Use to detect exposure to cocaine.

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 20 ng/mL

For medical purposes only; not valid for forensic use.

The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Reference Interval:

Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Benzoylecgonine	20 ng/mL

Methodology:

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Cocaine Metabolite, Urine, Quantitative

LAB6102

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Cocaine
- Crack
- Pain Management
- Benzoylecgonine
- Benzoylmethylecgonine
- LAB6102-VML
- LAB6102VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 1 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Performed:
Sun-Sat

ORDERING

Synonyms:

- Cocaine
- Crack
- Pain Management
- Benzoylecgonine
- Benzoylmethylecgonine
- LAB6102-VML
- LAB6102VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Cocaine, Urine Screen with Reflex to Quantitation (2012231).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

Notes:
Compare to Pain Management, Cocaine Metabolite with Confirmation with medMATCH, Urine; Pain Management, Cocaine Metabolite, Quantitative, with medMATCH, Urine.

RESULTS INTERPRETATION

Reference Interval:
Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Benzoylecgonine	50 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 50 ng/mL

For medical purposes only; not valid for forensic use.

The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Coenzyme Q10, Total

LAB3723

ORDERING INFO

Collect:
Plasma separator tube, green (sodium or lithium heparin), serum separator tube, or plain red.

Synonyms:

- CoQ10
- LAB3723-VML
- LAB3723VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should fast overnight prior to specimen collection. Patient may have water. It is not necessary to discontinue nutritional supplements prior to this test.

Collect:
Plasma separator tube, green (sodium or lithium heparin), serum separator tube, or plain red.

Specimen Preparation:
Separate plasma or serum from cells within 1 hour of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Specimens other than heparinized plasma or serum. Hemolyzed specimens. Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 3 weeks; Frozen: 1 month

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- CoQ10
- LAB3723-VML
- LAB3723VML

Ordering Recommendations:
Monitor replacement therapy in coenzyme Q deficiencies; not useful in coenzyme Q deficiency diagnosis.

Performed:
Tue, Thu, Sat

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
0.4-1.6 mg/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Cold Agglutinin Screen, blood

LAB3128

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- CAS, Cold Agglutinin Screen
- LAB3128-VML
- LAB3128VML

Turn Around Time:
1 day

SPECIMEN REQUIREMENTS

Patient Preparation:
Place specimen immediately on heel warmer and transported to the Blood Bank

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Refer to SOP: Labeling of Laboratory Specimens section III.C. for labeling requirements specific to Blood Bank Specimens.

Pediatric Collection:
Pediatric Lavendar tube (EDTA)

Storage/Transport Temperature:
37°C (transport in heel warmer)

Performed:
Daily

Stability:
3 days after separation of plasma

Specimen:
Plasma

Alternate Specimen:
NA

ORDERING

Ordering Indicators:
Aid in diagnosis of Cold Agglutinin Syndrome

Synonyms:

Complement Component 1Q Level

LAB3709

ORDERING INFO

Collect:
Lavender (EDTA) or pink (K_2EDTA).

Synonyms:

- C1
- C1 esterase inhibitor
- C1q
- C1q Level
- Complement Component C1q
- First Component of Complement
- Total Complement
- Total Hemolytic Complement Activity
- LAB3709-VML
- LAB3709VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or pink (K_2EDTA).

Specimen Preparation:
Separate plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 0.1 mL)

Unacceptable Conditions:
Grossly hemolyzed, hyperlipemic, or room temperature specimens. Serum or non-EDTA plasma.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 48 hours; Frozen: 1 month

Performed:
Tue, Fri

ORDERING

Synonyms:

- C1
- C1 esterase inhibitor
- C1q
- C1q Level
- Complement Component C1q
- First Component of Complement
- Total Complement
- Total Hemolytic Complement Activity
- LAB3709-VML
- LAB3709VML

Ordering Recommendations:
Aids in the diagnosis of C1q deficiency. For testing to detect circulating immune complexes, refer to Circulating Immune Complex, C1q Binding (0050301).

Performed:
Tue, Fri

Methodology:
Radial Immunodiffusion

Reported:
5-10 days

Notes:
For the C1q Binding assay, refer to ARUP test code 0050301. The C1q Binding assay detects circulating immune complexes. The Complement Component 1q Level assay quantifies the active fraction component, C1q, of the C1 complement protein complex.

RESULTS INTERPRETATION

Reference Interval:
109-242 µg/mL

Methodology:
Radial Immunodiffusion

ADDITIONAL INFORMATION

CPT Codes:
86160

Section:
RF-ARUP

Notes:

Complement Component 2

LAB153

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- C2
- C2 Antigen
- C2 Level
- Classical Pathway - Complement
- complement classical pathway
- Second componenet of complement
- LAB153-VML
- LAB153VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Allow specimen to clot for one hour at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube and freeze immediately. (Min: 0.3 mL)

Unacceptable Conditions:
Non-frozen specimens. Specimens exposed to repeated freeze/thaw cycles. Specimens left to clot at refrigerated temperature.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 hours; Refrigerated: Unacceptable; Frozen: 2 weeks

Performed:
Mon, Thu

ORDERING

Synonyms:

- C2
- C2 Antigen
- C2 Level
- Classical Pathway - Complement
- complement classical pathway
- Second componenet of complement
- LAB153-VML
- LAB153VML

Ordering Recommendations:
Follow-up test for complement activity screening when CH50 is low or absent and AH50 is normal and high suspicion remains for complement deficiency.

Performed:
Mon, Thu

Methodology:
Quantitative Radial Immunodiffusion

Reported:
5-10 days

RESULTS INTERPRETATION

Reference Interval:
Effective May 21, 2018
1.6-4.0 mg/dL

Interpretive Data:
Decreased C2 levels may be associated with increased susceptibility to infection (especially pneumococcal infections), systemic lupus erythematosus-like disease, rashes, arthritis, nephritis, and with C1-Esterase deficiency. Increased C2 levels are associated with the acute phase response.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Complete Blood Count

LAB294

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- CBP, Complete Blood Count, Hemogram, CBC with Platelet
- LAB294-VML
- LAB294VML

Turn Around Time:
STAT 1 hour; Routine 2 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Collect to fill line on tube, gently invert back and forth immediately for blood to mix with EDTA anitcoagulant to prevent clotting. Do not draw above IV line. (Min 1.0 mL)

Pediatric Collection:
Pediatric: 160 microliters minimum

Storage/Transport Temperature:
Refrigerated preferred, or ambiant temperature, DO NOT FREEZE

Performed:
Daily

Stability:
Room temperature: 8 hrs, 2 to 8 degrees C: 24 hrs

Specimen:
Whole Blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:

Comprehensive Cardiac NGS Panel, Blood Saliva DNA

LAB6274

ORDERING INFO

Collect:

Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Synonyms:

- LAB6274, Comprehensive Cardiac NGS Panel, Next Generation Sequencing, Sudden cardiac arrest, Brugada Syndrome, Atrial Fibrilation, Bradycardia
- LAB6274-VML
- LAB6274VML

Turn Around Time:

30 Business Days From Financial Clearance

SPECIMEN REQUIREMENTS

Patient Preparation:

Saliva: Patient Must Follow Kit Instructions

Collect:

Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Specimen Preparation:

Extracted DNA should be sent in a screw cap tube with at least 2 micrograms - 5 micrograms of purified DNA at a concentration of at least 20 ng/ul - 50 ng/uL. Indicate patient's name, date of birth, and concentration on tube label. (Minimum Volume: 2 micrograms for limited specimens)

Pediatric Collection:

REVIEW

Storage/Transport Temperature:

Blood: Ambient (15-25°C), Saliva: Ambient (15-25°C), DNA Ambient (15-25°C)

Performed:

Weekly

Stability:

Blood Ambient (15-25°C): 72 Hours, Saliva Ambient (15-25°C): 2 weeks, DNA Ambient (15-25°C): 48 Hours

Specimen:

N/A

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Preferred test to determine genetic causes for individuals with cardiomyopathy, arrhythmia, or a family history of heart failure or sudden cardiac death.

Synonyms:

- LAB6274, Comprehensive Cardiac NGS Panel, Next Generation Sequencing, Sudden cardiac arrest, Brugada Syndrome, Atrial Fibrilation, Bradycardia
- LAB6274-VML
- LAB6274VML

Performed:

Weekly

Turn Around Time:
30 Business Days From Financial Clearance

Methodology:
Next Generation Sequencing

Components:
Sequence and del/dup analysis of coding exons for genes associated with channelopathies and cardiomyopathies

RESULTS INTERPRETATION

Reference Interval:
Not Established for This Test

Interpretive Data:
N/A

Methodology:
Next Generation Sequencing

ADDITIONAL INFORMATION

Section:
Clinical Genomics

Alternate Specimen:
N/A

Additional Information:
Gene List Available at the Following Website (https://www.vumc.org/vcgl), in Hubble and Upon Request. *FOR DNA SAMPLES* Extracted DNA Must be Received From a CAP/CLIA Certified Laboratory.

Congenital Cytomegalovirus (cCMV) Detection by Qualitative PCR

LAB1332

ORDERING INFO

Collect:

Saliva: Viral/Universal Transport Media (VTM/UTM)

Urine: Sterile Container

Synonyms:

- LAB1332, CMD, CMV Infant Saliva, Cytomegalovirus by PCR, CMV Qualitative PCR Urine, Congenital CMV PCR
- LAB1332-VML
- LAB1332VML

Turn Around Time:

2 days

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Saliva: Viral/Universal Transport Media (VTM/UTM)

Urine: Sterile Container

Specimen Preparation:

Infant Saliva: Use swab to collect saliva and place in 1mL VTM/UTM tube. Urine: Collect at least 0.5mL of urine in sterile container. (Min 1.0mL VTM/UTM), (Min 0.5mL Urine)

Pediatric Collection:

Saliva: VTM tube (1mL)

Storage/Transport Temperature:

Infant Saliva in VTM/UTM: Ambient (15-25°C), Urine: Refrigerated (2-8°C)

Performed:

Sunday, Monday, Wednesday, Friday

Stability:

Infant Saliva in VTM/UTM: 24 hours, Ambient (15-25°C) ; 72 hours Refrigerated (2-8°C). Urine: 2 hours Ambient (15-25°C), ; 8 hours, Refrigerated (2-8°C).

Specimen:

Infant Saliva: Swab collected in VTM/UTM pediatric tube. Urine

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

The DiaSorin Molecular Simplexa Congenital CMV Direct is a real time PCR assay intended for use on the LIAISON MDX instrument for the in vitro qualitative detection of cytomegalovirus (CMV) from saliva swabs and urine from infants less than 21 days of age.

Synonyms:

- LAB1332, CMD, CMV Infant Saliva, Cytomegalovirus by PCR, CMV Qualitative PCR Urine, Congenital CMV PCR
- LAB1332-VML
- LAB1332VML

Performed:

Sunday, Monday, Wednesday, Friday

Turn Around Time:

2 days

Methodology:

PCR (Polymerase Chain Reaction)

Components:

N/A

RESULTS INTERPRETATION

Reference Interval:
CMV: Not Detected

Interpretive Data:
All results should be used in conjunction with the results of other clinical findings to aid with diagnosing congenital CMV (cCMV) infection. Positive saliva testing should be confirmed by urine testing. False positivie results are possible if saliva specimens are obtained shortly after breastfeeding.

Methodology:
PCR (Polymerase Chain Reaction)

Copper, Serum or Plasma

LAB817

ORDERING INFO

Collect:
Royal blue (No Additive), Royal blue (K2EDTA), or Royal blue (NaHep).

Synonyms:

- Copper Plasma
- Cu
- Cu, Plasma
- CUS
- Kaiser Fleischer Ring
- total blood copper level
- Wilson disease
- LAB817-VML
- LAB817VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician).

Collect:
Royal blue (No Additive), Royal blue (K2EDTA), or Royal blue (NaHep).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum or plasma to an ARUP Trace Element-Free Transport Tube (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens that are not separated from the red cells or clot within 2 hours. Specimens collected in containers other than specified. Specimens transported in containers other than specified.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated or frozen.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Indefinitely

Performed:
Sun-Sat

ORDERING

Synonyms:

- Copper Plasma
- Cu
- Cu, Plasma
- CUS
- Kaiser Fleischer Ring
- total blood copper level
- Wilson disease
- LAB817-VML
- LAB817VML

Ordering Recommendations:
Useful in the assessment of deficiency or overload. Measures both protein-bound and free forms of copper in serum or plasma.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Age	Male	Female
0-10 years	75.0-153.0 µg/dL	75.0-153.0 µg/dL
11 years-12 years	64.0-132.0 µg/dL	64.0-132.0 µg/dL
13 years-18 years	57.0-129.0 µg/dL	57.0-129.0 µg/dL
19 years and older	70.0-140.0 µg/dL	80.0-155.0 µg/dL

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of serum/plasma copper, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Serum copper may be elevated with infection, inflammation, stress, and copper supplementation. In females, elevated copper may also be caused by oral contraceptives and pregnancy (concentrations may be elevated up to 3 times normal during the third trimester).

Serum copper may be reduced by use of corticosteroids and zinc and by malnutrition or malabsorption.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Copper, Urine

LAB380

ORDERING INFO

Collect:
24 hour urine. Refrigerate during collection. Specimen must be collected in a plastic container. Also acceptable: Random urine.

Synonyms:

- 24-hour urine copper
- Copper/Creatinine Ratio, Urine
- Cu
- CUU
- Normalized Urine Copper
- Normalized Urine Cu
- LAB380-VML
- LAB380VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and nonessential over-the-counter medications (upon the advice of their physician). Collection from patients receiving iodinated or gadolinium-based contrast media must be avoided for a minimum of 72 hours postexposure. Collection from patients with impaired kidney function should be avoided for a minimum of 14 days postcontrast media exposure.

Collect:
24 hour urine. Refrigerate during collection. Specimen must be collected in a plastic container. Also acceptable: Random urine.

Specimen Preparation:
Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787. (Min: 1 mL)

Unacceptable Conditions:
Specimens collected within 72 hours after administration of iodinated or gadolinium-based contrast media.. Acid preserved urine. Specimens transported in containers other than specified. Specimens contaminated with blood or fecal material.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

Remarks:
Record total volume and collection time interval on transport tube and on test request form.

ORDERING

Synonyms:

- 24-hour urine copper
- Copper/Creatinine Ratio, Urine
- Cu
- CUU
- Normalized Urine Copper
- Normalized Urine Cu
- LAB380-VML
- LAB380VML

Ordering Recommendations:
Useful in the assessment of overload.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-5 days

Notes:
High concentrations of iodine or gadolinium may interfere with elemental testing.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Copper, Urine - per volume	Less than or equal to 3.2 µg/dL
Copper, Urine - per 24h	3.0-45.0 µg/d
Creatinine, Urine - per 24h	See table below
Copper, Urine - ratio to CRT	10.0-45.0 µg/g CRT

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Interpretive Data:
Individuals with symptomatic Wilson disease usually excrete more than 100 µg copper per day. Other conditions associated with elevated urine copper include cholestatic liver disease, proteinuria, some medications, and contaminated specimens. Although random specimens may contain diagnostic information, a 24-hour collection is a more consistent indicator of copper urine.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Section:
RF-ARUP

CPT Codes:
82525

Remarks:
Record total volume and collection time interval on transport tube and on test request form.

Notes:
High concentrations of iodine or gadolinium may interfere with elemental testing.

Cord blood workup

LAB892

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- CBWT, DAG, Type and Coombs
- LAB892-VML
- LAB892VML

Turn Around Time:
1 day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Refer to SOP: Labeling of Laboratory Specimens section III.C. for labeling requirements specific to Blood Bank Specimens.

Pediatric Collection:
Lavender microtainer (EDTA)

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Ambient: (15-25°C): 3 days

Specimen:
Cord blood

Alternate Specimen:
NA

ORDERING

Ordering Indicators:
Determine incompatibility for evaluation of Hemolytic Disease of the fetus and newborn.

Synonyms:

- CBWT, DAG, Type and Coombs
- LAB892-VML
- LAB892VML

Performed:
Daily

Turn Around Time:
1 day

Methodology:
agglutination and antiglobulin testing

Components:
ABO, Rh type and IgG antihumanglobulin test

RESULTS INTERPRETATION

Reference Interval:

Cortisol by LC-MS/MS, Salivary

LAB6614

ORDERING INFO

Collect:
Saliva. Swab must be completely saturated to ensure sufficient volume for testing.

Synonyms:

- LAB6614-VML
- LAB6614VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Do not collect specimen within 60 minutes after eating a meal, within 12 hours after consuming alcohol, immediately after brushing teeth, or after any activity that may cause gums to bleed. Rinse mouth thoroughly with water 10 minutes before specimen collection. Recommended collection time is between 11:00 p.m.-1:00 a.m.

Collect:
Saliva. Swab must be completely saturated to ensure sufficient volume for testing.

Specimen Preparation:
Transfer saturated swab to plain (noncitric acid) cotton Salivette collection device (ARUP Supply #52056). Record the time of collection on the test request form, and on Salivette transport container.

Unacceptable Conditions:
Specimens not collected using the Salivette collection device. Sodium azide preservative. Specimens with pH values greater than 9.0 or less than 3.5 must be recollected. Specimens visibly contaminated with blood, cellular debris, food particles, or mucus.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 week
Refrigerated: 3 weeks
Frozen: 6 months

Performed:
Mon-Sat

ORDERING

Synonyms:

- LAB6614-VML
- LAB6614VML

Ordering Recommendations:
Use to rule out Cushing syndrome or screen for thymic and bronchial carcinoid tumors.

Performed:
Mon-Sat

Methodology:
Quantitative: Mass Spectrometry

Reported:
1-4 days

Notes:
Bovine hormones normally present in dairy products can cross-react with anticortisol antibodies and cause false results. Acidic or high sugar foods can compromise assay performance by lowering sample pH and influencing bacterial growth. Samples with pH values greater than 9.0 or less than 3.5 must be recollected.

Testing is not New York approved, and there are no NY approved laboratories available. Specimens received from NY clients need to be placed on Except. Client can either cancel testing, request specimen be returned, or submit a New York State Non-Permitted Laboratory Request Form (NPL) to NYSDOH requesting approval for ARUP to perform testing.

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:

Reference Intervals:

7 a.m. to 9 a.m.: 0.1-0.75 ug/dL

3 p.m. to 5 p.m.: <0.401 ug/dL

11 p.m. to midnight: <0.1 ug/dL

Cortisol Urine Free by LC-MS/MS

LAB568

ORDERING INFO

Collect:
24-hour or random urine. Refrigerate 24-hour specimen during collection.

Synonyms:

- Cortisol, Free, LC/MS/MS, Second Void Urine
- Urinary Free Cortisol
- LAB568-VML
- LAB568VML

SPECIMEN REQUIREMENTS

Collect:
24-hour or random urine. Refrigerate 24-hour specimen during collection.

Specimen Preparation:
Transport one 4 mL aliquot of urine. (Min: 1 mL) Record total volume and collection time interval on transport tube and test request form.

Unacceptable Conditions:
Room temperature specimens. Acidified specimens or specimens with preservatives.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Cortisol, Free, LC/MS/MS, Second Void Urine
- Urinary Free Cortisol
- LAB568-VML
- LAB568VML

Ordering Recommendations:
Rule-out Cushing syndrome.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Reference intervals based on literature from Taylor R.L. et al., Validation of a High-Throughput Liquid Chromatography-Tandem Mass Spectrometry Method for Urine Cortisol and Cortisone. Clinical Chemistry 2002; 48:1511-1519.

RESULTS INTERPRETATION

Reference Interval:

Components

Reference Interval

Creatinine, Urine - per 24h

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Cortisol, Urine Free - ratio to CRT

Age	Male (ug/g CRT)	Female (ug/g CRT)
Prepubertal	Less than 25	Less than 25
18 years and older	Less than 32	Less than 24
Pregnancy	Not Applicable	Less than 59

Cortisol, Urine Free - per 24h

Age	Male (ug/24 h)	Female (ug/24 h)
3-8 years	Less than or equal to 18	Less than or equal to 18
9-12 years	Less than or equal to 37	Less than or equal to 37
13-17 years	Less than or equal to 56	Less than or equal to 56
18 years and older	Less than or equal to 60	Less than or equal to 45

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Coxsackie A9 Virus Antibodies by CF

LAB3725

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Coxsackie A Antibodies
- Coxsackie A Ab Panel
- Enterovirus
- LAB3725-VML
- LAB3725VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as acute or convalescent.

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Coxsackie A Antibodies
- Coxsackie A Ab Panel
- Enterovirus
- LAB3725-VML
- LAB3725VML

Ordering Recommendations:
May be used to confirm disease occurrence if PCR or culture is not a viable option.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Complement Fixation

Reported:
2-5 days

RESULTS INTERPRETATION

Reference Interval:
Less than 1:8

Interpretive Data:
Single positive antibody titers of greater than 1:32 may indicate past or current infection. Seroconversion or an increase in titers between acute and convalescent sera of at least fourfold is considered strong evidence of current or recent infection.

Methodology:
Semi-Quantitative Complement Fixation

Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Ordering Indicators:
N/A

Interpretive Data:
Nonfasting specimens can be as high as 9.0 ng/mL.

Reference Interval:
1.1 - 4.4 ng/mL

Additional Information:
Samples should not be taken from patients receiving therapy with biotin doses until at least 8 hours following the last biotin administration.

Methodology:
Electrochemiluminescent Immunoassay

C-Reactive Protein (CRP), Plasma

LAB149

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- CRP, C Reactive Protein Blood, LAB149
- LAB149-VML
- LAB149VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.3 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 15 days; 2° to 8°C: 2 months; Frozen: 1 years

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:
Not recommended for overall cardiovascular disease risk evaluation in asymptomatic adults, but may assist in stratifying cardiovascular disease risk in certain populations.

Synonyms:

- CRH, High Sensitivity CRP, C Reactive Protein, LAB150
- LAB150-VML
- LAB150VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Immunoturbidimetry

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
3.0 mg/L or less

Interpretive Data:
Patients exhibiting elevated hs-CRP concentrations face an increased likelihood of developing stroke, myocardial infarction, and severe peripheral vascular disease. CRP, a nonspecific inflammation marker, may show elevated levels due to various conditions beyond atherosclerosis. If the initial result surpasses 3.0 mg/L, it is advisable to repeat the test at least 2 weeks later in a metabolically stable state, devoid of infection or acute illness. The lower of the two results is recommended for assessing the patient's risk.

Methodology:
Immunoturbidimetry

Creatine Kinase Isoenzymes

LAB64

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plain Red.

Synonyms:

- CK
- CK Fractionation
- CK Isoenzyme Electrophoresis
- CK Isoenzymes
- CK Macro
- CK-BB
- CK-MM
- CKBB
- CKMB
- CPK
- CPK Isoenzymes (Creatine Phosphokinase Isoenzymes)
- Creatine Phosphokinase
- Isoenzymes, CK
- CPK Isoenzyme Electrophoresis
- Isoenzyme of Creatine Kinase
- Macro CK
- Macro Creatine Kinase
- Mitochondrial C
- LAB64-VML
- LAB64VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens preserved in citrate, EDTA, fluoride, heparin, or iodoacetate. Grossly hemolyzed specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- CK
- CK Fractionation
- CK Isoenzyme Electrophoresis
- CK Isoenzymes
- CK Macro
- CK-BB
- CK-MM
- CKBB
- CKMB
- CPK
- CPK Isoenzymes (Creatine Phosphokinase Isoenzymes)
- Creatine Phosphokinase
- Isoenzymes, CK
- CPK Isoenzyme Electrophoresis
- Isoenzyme of Creatine Kinase
- Macro CK
- Macro Creatine Kinase
- Mitochondrial C
- LAB64-VML
- LAB64VML

Ordering Recommendations:
Aid in determining the etiology of elevated total creatine kinase. May aid in identifying the presence of macro creatine kinase. Troponin testing is recommended for diagnosis and management of acute coronary syndrome; refer to Troponin T (cTnT) 5th Generation (3001831).

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay/Electrophoresis

Reported:
2-3 days

Notes:
This test will detect CK macroenzymes.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval		
CK-MM	96-100%

Cryptococcus antigen, CSF

LAB927

ORDERING INFO

Collect:

Sterile screwtop tube - submit tube 2 of CSF collection.

Synonyms:

- CRY, CSF Cryptococcus, CrAg
- LAB927-VML
- LAB927VML

Turn Around Time:

1 day

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Sterile screwtop tube - submit tube 2 of CSF collection.

Specimen Preparation:

Send to laboratory immediately following collection (Min 0.5mL fluid)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient: (15-25°C) (Refrigerated: (2-8°C)

Performed:

Daily

Stability:

Send to laboratory immediately. Ambient: (15-25°C) 24 hours; Refrigerated: (2-8°C) 72 hours.

Specimen:

Cerebrospinal fluid (CSF)

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Assessment of cryptococcal meningitis.

Synonyms:

- CRY, CSF Cryptococcus, CrAg
- LAB927-VML
- LAB927VML

Performed:

Daily

Turn Around Time:
1 day

Methodology:
Immunochromatographic detection.

Components:
Cryptococcal antigen and titer, if positive.

RESULTS INTERPRETATION

Reference Interval:
Negative.

Interpretive Data:
N/A

Methodology:
Immunochromatographic detection.

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
N/A

Additional Information:
Titer performed if positive. Positive results alerted to the clinical team. Must be submitted with a request for fungal culture.

Components:
Cryptococcal antigen and titer, if positive.

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:

CSF Amino Acid Screen, cerebral spinal fluid (CSF)

LAB3149

ORDERING INFO

Collect:

Sterile container

Synonyms:

- LAB3149, CSA
- LAB3149-VML
- LAB3149VML

Turn Around Time:

STAT: 24 hours (STAT testing must be called to lab in advance and approved by the medical director) Routine: 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Patient should be fasting for 2 - 3 hours prior to collection.

Collect:

Sterile container

Specimen Preparation:

All CSF specimens must be accompanied with a plasma specimen that was drawn within 24 hours to calculate CSF/Plasma glycine ratio. CSF must be delivered to lab on ice and stored frozen. Do not centrifuge. (Minimum 0.2 mL CSF)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Frozen (-20°C)

Performed:

Monday - Friday

Stability:

Frozen (-20°C): 6 months

Specimen:
CSF

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is used to diagnose non-ketotic hyperglycinemia.

Synonyms:

- LAB3149, CSA
- LAB3149-VML
- LAB3149VML

Performed:
Monday - Friday

Turn Around Time:
STAT: 24 hours (STAT testing must be called to lab in advance and approved by the medical director) Routine: 3 days

Methodology:
Liquid chromatography/tandem mass spectrometry

Components:
Histidine, Asparagine, Taurine, Serine, Glutamine, Arginine, Glycine, Aspartic Acid, Citrulline, Threonine, Alanine, Alpha Aminobutyric Acid, Ornithine, Lysine, Tyrosine, Methionine, Valine, Isoleucine, Leucine, Phenylalanine, Miscellaneous Amino Acid

RESULTS INTERPRETATION

Reference Interval:
Supplied with results

Interpretive Data:
A ratio of CSF:plasma glycine greater than 0.08 is considered diagnostic of non-ketotic hyperglycinemia (ratios of 0.04 - 0.08 are equivocal; < 0.02 is normal).

Methodology:
Liquid chromatography/tandem mass spectrometry

ADDITIONAL INFORMATION

CSF CYTOLOGY

csf

ORDERING INFO

Collect:
Clean specimen container and/or the Plastic LP tube. The third or fourth tube collected is preferable for cytology.

Synonyms:

- Cerebrospinal fluid

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container and/or the Plastic LP tube. The third or fourth tube collected is preferable for cytology.

Specimen Preparation:
1. The CSF specimen is collected in the appropriate specimen container (min 1 mL). 2. Place Epic order for Cytology CSF (Answering "Suspected or confirmed diagnosis of leukemia or lymphoma" question determines which Cytology testing is needed). The lab must be informed if patient had prior or has suspected leukemia or lymphoma. Specimens on patients with a history of carcinoma or other non-hematopoietic disease processes are directed to the CSF Cytology test for the Cytopathology lab, while patients with a history of lymphoma or leukemia are directed to the CSF Hematology test for the Hematopathology lab. 3. Indicate specimen source when completing the collection task in Epic. 4. Specimen vial is to be labeled with label ready labels. 5. Please send Epic requisition when there is no history of leukemia or lymphoma or if it is unknown, along with the specimen vial(s) to the lab. (Minimum: Obtain as much as clinical judgement allows)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Refrigerated: (2-8°C) is optimal. Call lab for assistance at 615-322-2721.

Performed:
Monday-Friday

Stability:
Refrigerated: (2-8°C) 6 days

Specimen:
Fresh specimen - deliver to the lab immediately

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc.

Synonyms:

- Cerebrospinal fluid

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
Cytocentrifuge procedure

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Methodology:
Cytocentrifuge procedure

ADDITIONAL INFORMATION

CSF Oligoclonal Bands

LAB3146

ORDERING INFO

Collect:

LP (CSF)

and Red top tube (no gel) (blood)

Synonyms:

- LAB3146, OLG, Olgio
- LAB3146-VML
- LAB3146VML

Turn Around Time:

7 days

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

LP (CSF)

and Red top tube (no gel) (blood)

Specimen Preparation:

This assay requires both serum and CSF. Serum should be collected in a 5 mL red top tube within 5 days of CSF collection. Refrigerate upon collection. If IgG Index is necessary, order corresponding ARUP send-out. (Min 1.0ml Blood)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Refrigerated: (2-8°C)

Performed:

2-3 times / week

Stability:

Refrigerated: (2-8°C): 24 hours, frozen (-20°C): 1 month

Specimen:
CSF and blood

Alternate Specimen:
LP Tube and Gold tube (With gel)

ORDERING

Ordering Indicators:
Indicated for identification of reactive immunologic processes in the CSF/CNS. If IgG index is necessary, also order corresponding ARUP send-out.

Synonyms:

- LAB3146, OLG, Olgio
- LAB3146-VML
- LAB3146VML

Performed:
2-3 times / week

Turn Around Time:
7 days

Methodology:
Serum/CSF Isoelectric focusing

Components:
CSF Oligoclonal Bands

RESULTS INTERPRETATION

Reference Interval:
No oligoclonal bands

Interpretive Data:
Oligoclonal bands present in the CSF alone (without corresponding bands in the serum) indicate a CSF-specific immune-mediated process. The presence of no CSF-specific oligoclonal bands is considered a normal result. The presence of 1-3 CSF-specific oligoclonal bands is reported as an equivocal result, with the number of bands observed provided. Four or more CSF-specific oligoclonal bands is reported as a positive result.

Methodology:
Serum/CSF Isoelectric focusing

ADDITIONAL INFORMATION

Section:
Hematopathology/ Flow Cytometry

Alternate Specimen:
LP Tube and Gold tube (With gel)

Additional Information:
MUST DRAW CSF AND 5 ML RED TOP BLOOD. INCLUDES OLIGOCLONAL IGG AND IGG INDEX ON CSF AND BLOOD SPECIMEN(S) MUST DRAW CSF IN ADDITION TO 4.5 ML LT GREEN TOP BLOOD AND 5 ML RED TOP BLOOD. INCLUDES OLIGOCLONAL IGG AND IGG INDEX ON CSF AND BLOOD SPECIMEN(S).

Components:
CSF Oligoclonal Bands

C-Telopeptide, Beta-Cross-Linked, Serum

LAB3727

ORDERING INFO

Collect:
Serum separator tube, lavender (K_2 EDTA or K_3 EDTA), pink (K_2 EDTA). A morning specimen is preferred.

Synonyms:

- B-Cross Laps
- bone resorption marker
- Carboxy terminal collagen crosslinks
- Collagen C Telopeptide
- Collagen Type I-C
- CTx
- Beta-CTx
- B-CTx
- Beta-Cross Laps
- C-Telopeptide
- C-terminal collagen crosslinks
- Collagen Type I-C Telopeptide
- LAB3727-VML
- LAB3727VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting specimen preferred.

Collect:
Serum separator tube, lavender (K_2 EDTA or K_3 EDTA), pink (K_2 EDTA). A morning specimen is preferred.

Specimen Preparation:
Allow serum separator tube to sit for 15-20 minutes at room temperature for proper clot formation. Centrifuge and separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Hemolyzed specimens. Green lithium heparin plasma

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 48 hours; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- B-Cross Laps
- bone resorption marker
- Carboxy terminal collagen crosslinks
- Collagen C Telopeptide
- Collagen Type I-C
- CTx
- Beta-CTx
- B-CTx
- Beta-Cross Laps
- C-Telopeptide
- C-terminal collagen crosslinks
- Collagen Type I-C Telopeptide
- LAB3727-VML
- LAB3727VML

Ordering Recommendations:
Preferred test to measure bone resorption and monitor response to antiresorptive therapy (eg, bisphosphonates, hormone replacement therapy) in postmenopausal women and individuals with osteoporosis.

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Age	Female	Male
6 months-6 years	500-1800 pg/mL	500-1700 pg/mL
7-9 years	566-1690 pg/mL	522-1682 pg/mL

Cyanide, Whole Blood

LAB6197

ORDERING INFO

Collect:
Gray top tube (Sodium Fluoride / Potassium Oxalate)

Synonyms:

- CN
- Hydrogen Cyanide
- Potassium Cyanide
- LAB6197-VML
- LAB6197VML

SPECIMEN REQUIREMENTS

Collect:
Gray top tube (Sodium Fluoride / Potassium Oxalate)

Specimen Preparation:
1 mL whole blood. (Min: 0.4 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

Stability (from collection to initiation):
Ambient: Undefined; Refrigerated: 1 week; Frozen: 3 months

Performed:
Varies

ORDERING

Synonyms:

- CN
- Hydrogen Cyanide
- Potassium Cyanide
- LAB6197-VML
- LAB6197VML

Ordering Recommendations:
Use to monitor cyanide exposure.

Performed:
Varies

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
8-11 days

Notes:
Studies have shown that cyanide has variable instability in biological specimens and is particularly unstable in some postmortem specimens. The loss of cyanide can be minimized by shipping the sample to the laboratory for analysis as soon as possible, preferably using refrigerated or frozen transportation and preservation using sodium fluoride/potassium oxalate (grey-top tube). The potential for increases in cyanide concentrations, although rare, have also been demonstrated and may be due to microbial action. Preservation with sodium fluoride may reduce this possibility.

RESULTS INTERPRETATION

Reference Interval:
By report

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Cyclic Citrulline Peptide (CCP), serum or plasma

LAB851

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB851, CCP, CCP IgG, Anti-CCP
- LAB851-VML
- LAB851VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used to evaluating patients suspected of having rheumatoid arthritis

Synonyms:

- LAB851, CCP, CCP IgG, Anti-CCP
- LAB851-VML
- LAB851VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
CCP IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result in conjunction with clinical features may be suggestive of rheumatoid arthritis.

Cyclosporine Trough Level, whole blood

LAB874

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB874, CYO, Cyclo, Sandimmune
- LAB874-VML
- LAB874VML

Turn Around Time:
24 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Specimens should be drawn immediately prior to dosing.

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Draw immediately before next dose at steady state. Ship in approved containers. (Minimum: 0.5 mL blood)

Pediatric Collection:
Lavender microtainer (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 1 week

Specimen:
Whole blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is used in the monitoring of cyclosporine in therapeutic intervention.

Synonyms:

Cystic Fibrosis (*CFTR*) Expanded Variant Panel

LAB6071

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA).

Synonyms:

- CF DNA Analysis
- CF Gene Mutation Panel
- CF Molecular Genetic Testing
- CF population carrier screening test
- Classic CF
- Cystic Fibrosis Genotyping
- LAB6071-VML
- LAB6071VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA).

Specimen Preparation:
Transport 3 mL whole blood. (Min: 1 mL)

Unacceptable Conditions:
Plasma or serum. Specimens collected in sodium heparin, yellow (ACD solution), or lithium heparin tubes. Frozen specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- CF DNA Analysis
- CF Gene Mutation Panel
- CF Molecular Genetic Testing
- CF population carrier screening test
- Classic CF
- Cystic Fibrosis Genotyping
- LAB6071-VML
- LAB6071VML

Ordering Recommendations:
Carrier screening for expectant individuals and those planning a pregnancy AND diagnostic testing for individuals with symptoms of classic CF.

Performed:
Sun-Sat

Methodology:
Matrix-Assisted Laser Desorption Ionization-Time of Flight (MALDI-TOF) Mass Spectrometry

Reported:
5-10 days

Notes:
The Cystic Fibrosis (CFTR) Expanded Variant Panel includes the 23 pathogenic CF variants recommended by the American College of Medical Genetics for carrier screening as well as many more.

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Refer to report.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Methodology:
Matrix-Assisted Laser Desorption Ionization-Time of Flight (MALDI-TOF) Mass Spectrometry

Cysticercosis Antibody, IgG by ELISA

LAB1236

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Neurocysticercosis
- Taenia solium Antibody
- Taenia solium IgG Antibody
- Tapeworm IgG antibody
- Cysticercosis AB, ELISA
- LAB1236-VML
- LAB1236VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
CSF. Contaminated, heat-inactivated, hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Sat

ORDERING

Synonyms:

- Neurocysticercosis
- Taenia solium Antibody
- Taenia solium IgG Antibody
- Tapeworm IgG antibody
- Cysticercosis AB, ELISA
- LAB1236-VML
- LAB1236VML

Ordering Recommendations:
Use to detect presence of IgG antibodies to T. solium in serum if clinical suspicion of cysticercosis exists.

Performed:
Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Cysticercosis Ab, IgG by ELISA	<9 U

Interpretive Data:

Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is a significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.

Patients with collagen vascular diseases, hepatic cirrhosis, schistosomiasis, and other parasitic infections can produce false-positive results. There is a strong cross-reaction between cysticercosis and echinococcosis positive sera. Confirmation of positive ELISA results by the cysticercosis antibody, IgG by Western blot is recommended.

Component	Unit Of Measure	Interpretation
Cysticercosis Ab, IgG by ELISA	<9 U 9-11 U >11 U	Negative - No significant level of cysticercosis IgG antibody detected. Equivocal - Recommend repeat testing in 2-4 weeks with fresh sample. Positive - IgG antibodies to cysticercosis detected, which may suggest current or past infection.

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Cytomegalovirus (CMV) by Quantitative PCR

LAB913

ORDERING INFO

Collect:

Plasma Preparation Tube (PPT) [EDTA]

Synonyms:

- LAB913, Cytomegalovirus, CMQ, CMV DNA quant
- LAB913-VML
- LAB913VML

Turn Around Time:

72 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Plasma Preparation Tube (PPT) [EDTA]

Specimen Preparation:

PPT tube must be centrifuged and plasma removed within 24 hours of collection. (0.8mL Plasma)

Pediatric Collection:

Lavender microtainer (EDTA)

Storage/Transport Temperature:

Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Blood: Up to 24 hours at Ambient (15-25°C), 6 days Refrigerated (2-8°C) once spun and plasma/serum separated.

Specimen:

Plasma (PPT)

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

CMV infection in immunocompetent individuals is usually asymptomatic; however, primary infection is associated with latency in a wide range of cells and tissues, including leukocytes. Immunocompromised individuals, including transplant patients and AIDS patients, are at risk for reactivation of latent CMV infection and development of severe disease. Clinical manifestations of CMV disease in immunocompromised hosts include fever, hematological abnormalities, retinitis, gastroenteritis, hepatitis, encephalitis, esophagitis, enterocolitis, pancreatitis, and pneumonia. Studies in transplant recipients have shown an association between CMV viral load in blood and risk of developing CMV disease. Similarly, increases in viral load over time have been associated with worse clinical outcomes. Quantitative PCR assays allow for diagnosis of active CMV infection, monitoring progression of disease, and assessing the virologic response to antiviral treatment.

Synonyms:

- LAB913, Cytomegalovirus, CMQ, CMV DNA quant
- LAB913-VML
- LAB913VML

Performed:

Monday - Friday

Turn Around Time:
72 hours

Methodology:
PCR (Polymerase Chain Reaction)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not Detected

Interpretive Data:
The quantitative range of this test is 1.54-7.00 log IU/mL (34.5-10,000,000 IU/mL). An interpretation of "Not Detected" does not rule out the presence of inhibitors or CMV DNA concentration below the level of detection of the assay. Care should be taken in the interpretation of any single viral load determination. International standardization has improved comparability of assay results across laboratories, but discrepancies still exist due to commutability issues with the standard.

Methodology:
PCR (Polymerase Chain Reaction)

Cytomegalovirus Antibody, IgG Avidity

LAB3721

ORDERING INFO

Collect:
Serum separator tube (SST).

Synonyms:

- LAB3721-VML
- LAB3721VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Tue

ORDERING

Synonyms:

- LAB3721-VML
- LAB3721VML

Ordering Recommendations:
Aid in the diagnosis of cytomegalovirus (CMV) infection during pregnancy after initial testing for CMV IgM and IgG has been performed.

Performed:
Tue

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
0.50 Index or less: Low Avidity
0.51-0.59 Index: Intermediate Avidity
0.60 Index or greater: High Avidity

Interpretive Data:
Identifying CMV infections in pregnant women during the first trimester is of significant importance for clinical care. Acute infection is typically characterized by increased CMV-specific IgM and IgG antibodies. However, CMV IgM antibodies may persist for several months or even years after initial infection, which limits their utility in the accurate diagnosis of recent CMV infection. CMV IgM antibodies can also be detected during viral reactivation, thus complicating the diagnosis of a recent primary infection. Therefore, measuring IgG antibody avidity to CMV antigens can aid in discriminating recent from prior CMV infections. Index values of 0.5 or less generally indicate recent infection (within the previous 3 to 4 months). However low avidity values cannot exclude the possibility of persistent IgG antibodies with low avidity. Index values of 0.6 or greater indicate an infection occurring more than 3 months prior to testing. Because IgG avidity testing for CMV after the first trimester is not easily interpreted, detection of high avidity CMV IgG antibodies during the first trimester (12 to 16 weeks gestation) helps exclude a diagnosis of an acute CMV infection post-conception.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Cytomegalovirus Drug Resistance by Next Generation Sequencing, Ganciclovir, Foscarnet, Cidofovir, Maribavir, and Letermovir

LAB6571

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), or plasma preparation tube.

Synonyms:

- Cytomegalovirus (CMV) drug resistance, next generation sequencing
- Cytomegalovirus antiviral drug resistance
- Cytomegalovirus (CMV) genotype
- LAB6571-VML
- LAB6571VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), or plasma preparation tube.

Specimen Preparation:
Separate plasma from cells within 24 hours. Transfer 3 mL plasma to an ARUP Standard Transport Tube. (Min: 2.5 mL)

Unacceptable Conditions:
Serum, heparinized specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 72 hours; Frozen: 1 month

Performed:
Sun-Sat

Remarks:
If available, please submit the following: most recent viral load and test date; information on current or past drug therapy.

ORDERING

Synonyms:

- Cytomegalovirus (CMV) drug resistance, next generation sequencing
- Cytomegalovirus antiviral drug resistance
- Cytomegalovirus (CMV) genotype
- LAB6571-VML
- LAB6571VML

Ordering Recommendations:
Provides antiviral susceptibility information for ganciclovir, foscarnet, cidofovir, maribavir, and letermovir. Intended for patients with viral load >2.6 log IU/mL.

Performed:
Sun-Sat

Methodology:
Massively Parallel Sequencing

Reported:
3-9 days

Notes:
This test may be unsuccessful if the plasma CMV DNA viral load is less than 2.6 log IU/mL.

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:

This assay assesses resistance to ganciclovir, foscarnet, cidofovir, maribavir, and letermovir. Resistance-associated mutations in the UL97, UL54, UL27, and UL56 genes are sequenced using next generation sequencing. Drug resistance is assigned using an ARUP-developed database of published resistance mutations. For a list of resistance mutations refer to https://ltd.aruplab.com/Tests/Pub/3004615.

This test detects populations down to 10% of the total population which may account for resistance interpretation differences between methods. Some insertions or deletions may be difficult to detect using this software.

Result interpretations are as follows:

- Sensitive indicates no evidence of drug resistance compared with a wild-type virus.
- Possible resistance indicates mutations were detected with borderline-level drug resistance or conflicting resistance status reported in the literature.
- Resistant indicates evidence of drug resistance compared with a wild-type virus.
- Not determined indicates incomplete sequence coverage across a given gene or genes.
- Additional mutations include variants that have not been associated with drug resistance.
- Uncalled mutation sites include drug resistance mutation positions with an inadequate number of sequencing reads.
- Inadequate sequence coverage indicates a low number of sequence reads at a given drug resistance site.

Drugs associated with each gene are as follows:

- UL97: ganciclovir, maribavir
- UL54: ganciclovir, foscarnet, cidofovir
- UL27: maribavir
- UL56: letermovir

This test was developed, and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Cytomegalovirus IgG and IgM, serum or plasma

LAB957

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB957, CMB, CMV IgG/IgM
- LAB957-VML
- LAB957VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA), Light blue tube (Sodium citrate), Light green tube (Lithium heparin with gel), Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used to assess current and past infection with cytomegalovirus.

Synonyms:

- LAB957, CMB, CMV IgG/IgM
- LAB957-VML
- LAB957VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
CMV IgG, CMV IgM

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The presence of IgG in the absence of IgM is indicative of past CMVinfection. The presence of IgM indicates recent CMV infection (primary, reactivation or reinfection). A negative IgM and IgG does not rule-out primary CMV infection.

Methodology:
Multiplex Flow Immunoassay

D-Dimer PE/DVT

LAB1120

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB1120, DVT, D dimer, Cross Linked Fibrin Degradation Products
- LAB1120-VML
- LAB1120VML

Turn Around Time:

2 hours once received into lab

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 8 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 8 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 8 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 8 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

D-Dimer PE/DVT provides a qualitative assessment to aid in the evaluation for adults with concern for PE/DVT. A quantitative D-Dimer is generally the recommended assay for all other clinical concerns.

Synonyms:

- LAB1120, DVT, D dimer, Cross Linked Fibrin Degradation Products
- LAB1120-VML
- LAB1120VML

Performed:
Daily

Turn Around Time:
2 hours once received into lab

Methodology:
Immunoturbidimetric

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Negative (< 0.50 mcg/mL FEU)

Interpretive Data:
Cloudy or lipemic plasma may lead to an underestimation of the D-dimer level. Elevated Fibrin Degradation Product (FDP/FSP) may lead to an over estimation of D-dimer level. Rheumatoid factor levels > 50 IU/mL may lead to an over estimation of the D Dimer level. The D-Dimer level increases during pregnancy and levels raise with age.

Methodology:
Immunoturbidimetric

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
The assay is not a quantitative D-dimer. It is report as positive (> 0.500 mcg/ml FEU) or negative (< or = to 0.499 mcg/mL FEU.)

Components:
N/A

Stability:

Refrigerated (2-8°C): 4 hours, frozen at -70C: 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB313, Cross Linked Fibrin Degradation Products, D dimer, DDI, D-Dimer Quantitative
- LAB313-VML
- LAB313VML

Performed:
Daily

Turn Around Time:
2 hours once received into lab

Methodology:
Immunoturbidimetric

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
<0.50 mcg/mL

Interpretive Data:
The results are reported in Fibrinogen Equlivant Units (FEU). Cloudy or lipemic plasma may lead to an underestimation of the D-dimer level. Elevated Fibrin Degradation Product (FDP/FSP) may lead to an over estimation of D-dimer level. Rheumatoid factor levels > 50 IU/mL may lead to an over estimation of the D Dimer level. The D-Dimer level increases during pregnancy and levels raise with age.

Methodology:
Immunoturbidimetric

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
D-dimer levels are reported in fibrinogen equivalent units (FEU). One FEU is the quanitity of fibrinogen initally present that leads to the observed level of D-dimer. The actual quantity of D-dimer is approximately half of an FEU.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:
Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 8 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:
Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Preferred Collection Volume:
Fill all tubes to indicator line.

Alternate Specimen:
N/A

Patient Preparation:
Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Specimen:
Citrated platelet poor plasma .

Reasons for Rejection:
Incorrect tube type, clotted, incorrect fill volume, received on ice, grossly hemolyzed, grossly icteric, grossly lipemic. Whole blood > 8 hours after collection. Thawed plasma aliquots.

Components:
N/A

Stability:
Refrigerated (2-8°C): 4 hours, frozen at -70C: 1 month

Storage/Transport Temperature:
Ambient: (15-25°C) for Light blue tube, must be received within 8 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 8 hours of collection.

Deamidated Gliadin Peptide (DGP) IgA and IgG, serum or plasma

LAB725

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB725, DGP, GLI, Celiac Disease Antibodies
- LAB725-VML
- LAB725VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA)

ORDERING

Ordering Indicators:
Evaluating patients suspected of having celiac disease, including patients with compatible symptoms, patients with atypical symptoms, and individuals at increased risk (family history, previous diagnosis with associated disease)

Synonyms:

- LAB725, DGP, GLI, Celiac Disease Antibodies
- LAB725-VML
- LAB725VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
Deamidated Gliadin IgA, Deamidated Gliadin IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The recommended screening test for celiac disease is tissue transglutaminase IgA (tTG IgA) . Tissue transglutaminase IgG (tTG IgG) and deamidated gliadin IgG should only be used for diagnosis when a patient has a total IgA deficiency. The IgG-based tests have a lower specificity and therefore a lower positive predictive value. If the patient has a positive serology and celiac disease is likely, consider consulting the VUMC adult celiac gastroenterology clinic or pediatric gastroenterology clinic to discuss diagnosis further. Patients should continue to consume gluten until seen in the clinic.

Methodology:
Multiplex Flow Immunoassay

Dehydroepiandrosterone Sulfate (DHEA-S), Serum

LAB524

ORDERING INFO

Collect:
Gold (Clot Activator with Gel)

Synonyms:

- DHA, Dehydroepiandrosterone, DHEA sulfate, DHEA-S, LAB524
- LAB524-VML
- LAB524VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Samples should not be taken from patients taking biotin until at least 8 hours following the last dose.

Collect:
Gold (Clot Activator with Gel)

Specimen Preparation:
Allow speicmen to clot completely at room temperature prior to centrifugation.
Separate serum from cells ASAP (Min 0.5 mL).

Pediatric Collection:
1 Gold Microtainer (Clot Activator with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:

Dehydroepiandrosterone, Serum or Plasma

LAB3729

ORDERING INFO

Collect:
Serum separator tube or green (sodium or lithium heparin). Also acceptable: Lavender (EDTA).

Synonyms:

- Unconjugated DHEA (Dehydroepiandrosterone, Serum or Plasma)
- DHEA (Dehydroepiandrosterone, Serum or Plasma)
- LAB3729-VML
- LAB3729VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect between 6-10 a.m.

Collect:
Serum separator tube or green (sodium or lithium heparin). Also acceptable: Lavender (EDTA).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.3 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Unconjugated DHEA (Dehydroepiandrosterone, Serum or Plasma)
- DHEA (Dehydroepiandrosterone, Serum or Plasma)
- LAB3729-VML
- LAB3729VML

Ordering Recommendations:
Adjunct test for the investigation of hyperandrogenic and adrenal disorders. Not recommended for initial evaluation of polycystic ovarian syndrome.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Dengue Fever Virus Antibodies, IgG and IgM

LAB3730

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Dengue Fever Antibodies
- Dengue Fever IgG and IgM Antibodies
- Dengue Fever Ab Panel
- Flavivirus
- LAB3730-VML
- LAB3730VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute or convalescent."

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Dengue Fever Antibodies
- Dengue Fever IgG and IgM Antibodies
- Dengue Fever Ab Panel
- Flavivirus
- LAB3730-VML
- LAB3730VML

Ordering Recommendations:
May aid in the diagnosis of dengue when timing of infection is uncertain. Testing should also be considered for other arthropod-borne viruses with similar symptomology based on clinical presentation and travel history.

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Dengue Fever Virus Antibody, IgG	1.64 IV or less
Dengue Fever Virus Antibody, IgM	1.64 IV or less

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Dengue Fever Virus Antibody, IgG	1.64 IV or less: Negative - No significant level of detectable dengue fever virus IgG antibody. 1.65-2.84 IV: Equivocal - Questionable presence of antibodies. Repeat testing in 10-14 days may be helpful. 2.85 IV or greater: Positive - IgG antibody to dengue fever virus detected, which may indicate a current or past infection.
Dengue Fever Virus Antibody, IgM	1.64 IV or less: Negative - No significant level of detectable dengue fever virus IgM antibody. 1.65-2.84 IV: Equivocal - Questionable presence of antibodies. Repeat testing in 10-14 days may be helpful. 2.85 IV or greater: Positive - IgM antibody to dengue fever virus detected, which may indicate a current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

Collect:
Urine.

Specimen Preparation:
Transfer 3.5 mL aliquot from a well-mixed, first-morning urine to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Patient Preparation:
First-morning void.

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 1 week; Frozen: 3 months

Storage/Transport Temperature:
Frozen.

Synonyms:

- DPD cross link urine
- DPD urine
- Pyrilinks-D
- urinary crosslinks DPD
- D-Pyrilinks
- LAB3231-VML
- LAB3231VML

Performed:
Tue

Resulting Laboratory:
ARUP Laboratories

Reported:
1-8 days

Interpretive Data:
The target value for treated postmenopausal adult females is the same as the premenopausal reference interval.

Reference Interval:
Effective May 18, 2015

Components	Reference Interval
Deoxypyridinoline, Urine - ratio to CRT	Adult Male: 2.3-8.7 nmol/mmol Premenopausal Adult Female: 3.1-8.7 nmol/mmol
Creatinine, Urine - per volume	

Methodology:
Quantitative Enzyme Immunoassay

Des-gamma-carboxy Prothrombin

LAB3731

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- DCP
- PIVKA-II
- LAB3731-VML
- LAB3731VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 1 week; Frozen: 3 weeks (avoid repeated freeze/thaw cycles)

Performed:
Mon, Thu

ORDERING

Synonyms:

- DCP
- PIVKA-II
- LAB3731-VML
- LAB3731VML

Ordering Recommendations:
Surveillance and monitoring of hepatocellular carcinoma.

Performed:
Mon, Thu

Methodology:
Quantitative Liquid Chromatography/Immunoassay

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 20, 2012

0.0 - 7.4 ng/mL

Interpretive Data:
The µTASWako method is used. Results obtained with different assay methods or kits cannot be used interchangeably. The des-gamma-carboxy prothrombin (DCP) assay is intended as a risk assessment for the development of hepatocellular carcinoma in patients with chronic liver diseases. Elevated DCP values have been shown to be associated with an increased risk for developing hepatocellular carcinoma. Patients with elevated serum DCP should be more intensely evaluated for evidence of hepatocellular carcinoma. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease.

Medication containing vitamin K preparations may cause a negative bias of the DCP values.
Medication containing vitamin K antagonist or antibiotic may cause a positive bias of the DCP values.

Methodology:
Quantitative Liquid Chromatography/Immunoassay

Dexamethasone, Serum or Plasma by LC-MS/MS

LAB3732

ORDERING INFO

Collect:
Serum separator tube, lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Synonyms:

- LAB3732-VML
- LAB3732VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Specimen should be collected between 8-10 a.m.

Collect:
Serum separator tube, lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 6 months

Performed:
Wed, Sat

ORDERING

Synonyms:

- LAB3732-VML
- LAB3732VML

Ordering Recommendations:
Compliance assessment of dexamethasone suppression testing.

Performed:
Wed, Sat

Methodology:
Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-5 days

RESULTS INTERPRETATION

Reference Interval:
Adults baseline: Less than 50 ng/dL
8:00 AM draw following 1 mg dexamethasone between 11:00 pm and 12:00 am the previous evening: 140 - 295 ng/dL
8:00 AM draw following 8 mg dexamethasone (4 x 2 mg doses) between 11:00 pm and 12:00 am the previous evening: 1600 - 2850 ng/dL

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Diazepam and Nordiazepam

LAB468

ORDERING INFO

Collect:
Gray (potassium oxalate/sodium fluoride). Also acceptable: Plain red, green (sodium heparin), lavender (K2 or K3EDTA) or pink (K2EDTA).

Synonyms:

- Valrelease
- Benzodiazepines
- Clorazepate
- Diastat
- Diazemuls
- Diazepam and Metabolite
- Nordiazepam
- Stesolid
- T-Quil
- Tranxene
- Valium
- Zetran
- LAB468-VML
- LAB468VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Predose (trough) draw at steady state concentration

Collect:
Gray (potassium oxalate/sodium fluoride). Also acceptable: Plain red, green (sodium heparin), lavender (K2 or K3EDTA) or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 2 mL serum or plasma to an ARUP standard transport tube. (Min: 1 mL)

Unacceptable Conditions:
Gel separator tubes. Plasma or whole blood collected in light blue (sodium citrate). Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 3 years (Avoid repeated freeze/thaw cycles)

Performed:
Tue, Fri

ORDERING

Diphtheria Antibody, IgG

LAB3734

ORDERING INFO

Collect:
Serum separator tube. "Pre" and "post" vaccination specimens should be submitted together for testing. "Post" specimen should be drawn 30 days after immunization.

Synonyms:

- Corynebacterium diphtheriae Antitoxin
- Diphtheria Antitoxoid
- Diptheria Vaccine Response
- LAB3734-VML
- LAB3734VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. "Pre" and "post" vaccination specimens should be submitted together for testing. "Post" specimen should be drawn 30 days after immunization.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL) Mark specimens clearly as "Pre-Vaccine" or "Post-Vaccine". If shipped separately, "Post" specimen must be received within 60 days of "Pre" specimen.

Unacceptable Conditions:
Plasma or other body fluids.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from the cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Corynebacterium diphtheriae Antitoxin
- Diphtheria Antitoxoid
- Diptheria Vaccine Response
- LAB3734-VML
- LAB3734VML

Ordering Recommendations:
Evaluate the ability of a patient to produce antibody to pure protein vaccine after vaccination to rule out antibody deficiency.

Performed:
Sun-Sat

Methodology:
Quantitative Multiplex Bead Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
Antibody concentration of > 0.1 IU/mL is usually considered protective.

Interpretive Data:

Responder status is determined according to the ratio of a one-month post-vaccination specimen to pre-vaccination concentration of diphtheria IgG antibody as follows:

1. If the post-vaccination concentration is less than 1.0 IU/mL, the patient is considered a nonresponder.
2. If the post-vaccination concentration is greater than or equal to 1.0 IU/mL, a patient with a ratio of less than 1.5 is a nonresponder, a ratio of 1.5 to less than 3.0, is a weak responder, and a ratio of 3.0 or greater, is a good responder.
3. If the pre-vaccination concentration is greater than 1.0 IU/mL, it may be difficult to assess the response based on a ratio alone. A post-vaccination concentration above 2.5 IU in this case is usually adequate.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Tuesday and Friday

Stability:
After separation from cells: Ambient (15-25°C): 72 hours Frozen (-20°C): 56 days

Specimen:
Plasma

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is used in conjunction with aldosterone as a screen for primary hyperaldosteronism (aldosterone/renin mass ratio).

Synonyms:

- LAB5712, Renin, Plasma Renin, Direct Renin, Renin Mass
- LAB5712-VML
- LAB5712VML

Performed:
Tuesday and Friday

Turn Around Time:
1 week

Methodology:
Chemiluminescent Immunoassay

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Upright: 2.5 - 45.7 pg/mL

Interpretive Data:

Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Collect, process, and centrifuge at ambient temperature. Do not refrigerate. Plasma should be transferred into an aliquot tube and stored frozen until ready for testing. (Minumum: 0.5 mL plasma)

Pediatric Collection:
Two lavender microtainers (EDTA)

Preferred Collection Volume:
1.5 mL blood

Alternate Specimen:
N/A

Patient Preparation:
N/A

Specimen:
Plasma

Reasons for Rejection:
Refrigeration of sample, QNS, freezing sample before spun down, grossly hemolyzed, grossly lipemic

Disaccharidase in Tissue

LAB3177

ORDERING INFO

Collect:
Biopsies of small bowel by endoscopy.

Synonyms:

- Isomaltase
- Lactase
- Sucrase
- Maltase
- Palatinase
- LAB3177-VML
- LAB3177VML

SPECIMEN REQUIREMENTS

Collect:
Biopsies of small bowel by endoscopy.

Specimen Preparation:
Place two 5 mg biopsies of tissue on the wall of a small, tightly-capped plastic tube without any supporting media or an ARUP Standard Transport Tube and freeze within 2 hours of collection. (Min: 2 (two) 5 mg biopsies)

Unacceptable Conditions:
Specimens placed on gauze, filter paper, or any other type of support media. Tissue preserved in formalin.

Storage/Transport Temperature:
Frozen. Ship on dry ice.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 6 months

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Isomaltase
- Lactase
- Sucrase
- Maltase
- Palatinase
- LAB3177-VML
- LAB3177VML

Ordering Recommendations:
Evaluate carbohydrate malabsorption due to disaccharidase deficiency.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Spectrophotometry

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:

Component	Reference Interval
Lactase	Greater than or equal to 10.0 µmol/min/g protein
Maltase	Greater than or equal to 100.0 µmol/min/g protein
Palatinase	Greater than or equal to 9.0 µmol/min/g protein
Sucrase	Greater than or equal to 25.0 µmol/min/g protein

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Spectrophotometry

DNA Fingerprint Analysis, Whole blood, tissue

LAB6086

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB6086, Identity testing
- LAB6086-VML
- LAB6086VML

Turn Around Time:

7 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Known and unknown samples are required for testing. Curls and unstained slides should be cut 10 micron thick with two accompanying H&E stained slides cut before and after unstained slides or curls. Tissue blocks will be returned after testing.

Pediatric Collection:

N/A

Storage/Transport Temperature:

EDTA and sodium heparin tubes: Ambient (15-25°C) or Refrigerated (2-8°C); paraffin block: Ambient (15-25°C); purified DNA: Refrigerated (2-8°C) or Frozen (-20°C)

Performed:

Monday - Friday

Stability:

EDTA and sodium heparin tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Paraffin block: indefinitely; Purified DNA: indefinitely at -70°C.

Specimen:

Blood, paraffin embedded tissue

Alternate Specimen:

Dark green tube (Sodium Heparin)

ORDERING

Ordering Indicators:

Suspected contamination of surgical pathology materials or suspected maternal-fetal engraftment during SCID evaluation. Amenable to various forms of genetic-based identity testing.

Synonyms:

- LAB6086, Identity testing
- LAB6086-VML
- LAB6086VML

Performed:

Monday - Friday

Turn Around Time:
7 days

Methodology:
Analysis of DNA polymorphisms for the identification of known versus unknown cells (identity/discrimination between samples) using fluorescent PCR with analysis by capillary electrophoresis

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
This assay will detect the presence of contaminating or maternal cells in a sample with a sensitivity of approximately 1%.

Methodology:
Analysis of DNA polymorphisms for the identification of known versus unknown cells (identity/discrimination between samples) using fluorescent PCR with analysis by capillary electrophoresis

DNase-B Antibody

LAB3736

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Anti-Dnase B
- Anti-DNase-B Antibody
- Antideoxyribonulease
- DNase-B, Anti
- ADB (Antideoxyribonuclease B)
- Anti-Hyaluronidase
- Antideoxyribonuclease B (ADB)
- DNA Streptococcal Antibody
- Hyaluronidase
- Serum Dnase-B Antibody
- Streptococcal Antibodies, Serum
- LAB3736-VML
- LAB3736VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL)

Unacceptable Conditions:
Plasma or severely hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 hours; Refrigerated: 8 days; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Anti-Dnase B
- Anti-DNase-B Antibody
- Antideoxyribonulease
- DNase-B, Anti
- ADB (Antideoxyribonuclease B)
- Anti-Hyaluronidase
- Antideoxyribonuclease B (ADB)
- DNA Streptococcal Antibody
- Hyaluronidase
- Serum Dnase-B Antibody
- Streptococcal Antibodies, Serum
- LAB3736-VML
- LAB3736VML

Ordering Recommendations:
Confirm current or recent infection with group A Streptococcus in patients suspected of having a nonsuppurative complication such as acute glomerulonephritis (AGN) or acute rheumatic fever (ARF). DNase-B Antibody (0050220) and Streptolysin O Antibody (ASO) (0050095) are generally ordered concurrently. Preferred test for rheumatic chorea since it remains elevated longer.

Performed:
Sun-Sat

Methodology:
Quantitative Nephelometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

0-6 years: Less than 250 U/mL
7-17 years: Less than 310 U/mL
18 years and older: Less than 260 U/mL

Interpretive Data:

Elevated titers of antideoxyribonuclease B antibody (anti-DNase B) or antistreptolysin O antibody (ASO) indicate a recent group A Streptococcus infection. Anti-DNase B antibodies typically remain elevated longer than ASO and may remain elevated for several months after infection. Patients suspected of having complications related to a recent Streptococcus infection such as acute glomerulonephritis or acute rheumatic fever may have elevated anti-DNase B but normal ASO antibody titers. A negative or very low anti-DNase B and ASO antibody titers, especially from a specimen tested 2 weeks after a suspected infection, indicates unlikely incidence of a recent Streptococcus infection.

Methodology:

Quantitative Nephelometry

Double-Stranded DNA (dsDNA) IgG, serum

LAB648

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB648, Anti-dsDNA, DNA, SLE
- LAB648-VML
- LAB648VML

Turn Around Time:
1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Refrigerated (2-8°C): 5 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used as an aid in the diagnosis of systemic lupus erythematosus. It can also be used for monitoring disease activity in SLE patients previously positive for double-stranded DNA IgG antibodies

Synonyms:

- LAB648, Anti-dsDNA, DNA, SLE
- LAB648-VML
- LAB648VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
Enzyme-linked Immunoassay

Components:
Anti-dsDNA

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result for double-stranded DNA (dsDNA) IgG antibodies in the appropriate clinical context is suggestive of systemic lupus erythematosus (SLE). A negative results do not rule out a diagnosis of SLE.

Methodology:
Enzyme-linked Immunoassay

ADDITIONAL INFORMATION

Drug Detection Panel, Meconium, Qualitative

LAB6411

ORDERING INFO

Collect:
All meconium (blackish material) excreted until milk/formula-based stool (yellow-green) appears.

Synonyms:

- LAB6411-VML
- LAB6411VML

SPECIMEN REQUIREMENTS

Collect:
All meconium (blackish material) excreted until milk/formula-based stool (yellow-green) appears.

Specimen Preparation:
Transport all available meconium (4 g is preferred) to routine urine collection cup or Security Kit for Meconium/Umbilical Drug Detection (ARUP supply #51548) available online through eSupply using ARUP Connect(TM) or by contacting ARUP Client Services at 800-522-2787.

Unacceptable Conditions:
Unknown fluids, pharmaceutical preparation, and breast milk. Diapers, cotton swabs, baby wipes, tongue depressors, bottles.

Storage/Transport Temperature:
Refrigerated temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 3 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- LAB6411-VML
- LAB6411VML

Ordering Recommendations:
Use to detect and document fetal drug exposure during approximately the last trimester of a full-term pregnancy. For panel testing that includes THC metabolite, refer to Drug Detection Panel and THC Metabolite, Meconium, Qualitative (3006373).

Performed:
Sun-Sat

Methodology:
Qualitative Liquid Chromatography-Tandem Mass Spectrometry (LC-MS/MS)

Reported:
1-3 days

Notes:
When ordering both meconium tests, unless ARUP is otherwise notified, testing will be performed in the following order of priority:

Drug Detection Panel (0.125g)
Marijuana (0.125g)

RESULTS INTERPRETATION

Reference Interval:

Drugs covered and range of cutoff concentrations.			
Drugs/Drug Classes	**Cutoff Concentrations (ng/g)**	**Drugs/Drug Classes**	**Cutoff Concentrations (ng/g)**
Buprenorphine	20	Amphetamine	20
Norbuprenorphine	20	Benzoylecgonine	20
Naloxone	20	m-OH-Benzoylecgonine	20
Codeine	20	Cocaethylene	20
Dihydrocodeine	20	Cocaine	20
Fentanyl	10	MDMA (Ecstasy)	20
Hydrocodone	20	Methamphetamine	20
Norhydrocodone	20	Phentermine	20
Hydromorphone	20	Alprazolam	5
Meperidine	20	Alpha-OH-Alprazolam	5
Methadone	10	Butalbital	50

N-desmethyltramadol	20	Temazepam	20
O-desmethyltramadol	20	Zolpidem	10
Gabapentin	20	Phencyclidine (PCP)	10
Mitragynine (Kratom)	25		

Interpretive Data:

Methodology: Qualitative Liquid Chromatography/Tandem Mass Spectrometry

Detection of drugs in meconium is intended to reflect maternal drug use during approximately the last trimester of a full-term pregnancy. The pattern and frequency of drug(s) used by the mother cannot be determined by this test. A negative result does not exclude the possibility that a mother used drugs during pregnancy. Detection of drugs in meconium depends on the extent of maternal drug use, as well as drug stability, unique characteristics of drug deposition in meconium, and the performance of the analytical method. Drugs administered during labor and delivery may be detected. Detection of drugs in meconium does not insinuate impairment and may not affect outcomes for the infant. Interpretive questions should be directed to the laboratory.

For medical purposes only; not valid for forensic use.

Methodology:

Qualitative Liquid Chromatography-Tandem Mass Spectrometry (LC-MS/MS)

Mitragynine (Kratom)	25		

Methodology:

Qualitative Liquid Chromatography-Tandem Mass Spectrometry (LC-MS/MS)

Section:

RF-ARUP

CPT Codes:

80326; 80347; 80364; 80355; 80323 (Alt code: G0481)

Notes:

When ordering both meconium tests, unless ARUP is otherwise notified, testing will be performed in the following order of priority:

Drug Detection Panel (0.125g)
Marijuana (0.125g)

Drug Detection Panel, Umbilical Cord Tissue, Qualitative

LAB3181

ORDERING INFO

Collect:
Umbilical Cord (At least 8 inches, approximately the width of a sheet of paper.)

Synonyms:

- Drug Screen, Targeted, Serum or Plasma
- Drugs of Abuse Panel, Meconium - Screen with Reflex to Confirmation/Quantitation
- LAB3181-VML
- LAB3181VML

SPECIMEN REQUIREMENTS

Collect:
Umbilical Cord (At least 8 inches, approximately the width of a sheet of paper.)

Specimen Preparation:
Drain and discard any blood. Rinse the exterior of the cord segment with normal saline or water. Pat the cord dry and transport at least 8 inches of umbilical cord in a routine urine collection cup or Security Kit for Meconium/Umbilical Drug Detection (ARUP supply #51548) available online through eSupply using ARUP Connect(TM) or by contacting ARUP Client Services at (800) 522-2787.

Unacceptable Conditions:
Cords soaking in blood or other fluid. Formalin fixed. Tissue that is obviously decomposed.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 3 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Drug Screen, Targeted, Serum or Plasma
- Drugs of Abuse Panel, Meconium - Screen with Reflex to Confirmation/Quantitation
- LAB3181-VML
- LAB3181VML

Ordering Recommendations:
Use to detect and document fetal drug exposure during approximately the last trimester of a full-term pregnancy. For panel testing that includes THC metabolite, refer to Drug Detection Panel and THC Metabolite, Umbilical Cord Tissue, Qualitative (3006371).

Performed:
Sun-Sat

Methodology:
Qualitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-3 days

Notes:
Absolute Minimum: 6 inches. For marijuana metabolite, order Marijuana Metabolite, Umbilical Cord Tissue, Qualitative (ARUP test code 3000256). For alcohol metabolite, order Ethyl Glucuronide, Umbilical Cord Tissue, Qualitative (ARUP test code 3000443).
For kratom metabolite, order Kratom, Umbilical Cord, Qualitative (ARUP test code 3005874)
When ordering multipleumbilical cord tests, unless ARUP is otherwise notified, testing will be performed in the following order of priority:

Drug Detection Panel (1.0g)
Marijuana Metabolite (1.0g)
Ethyl Glucuronide (1.0g)
Kratom(1.0 g)

RESULTS INTERPRETATION

Reference Interval:

Effective February 20, 2018

Drugs covered and range of cutoff concentrations.			
Drugs/Drug Classes	**Cutoff Concentrations (ng/g)**	**Drugs/Drug Classes**	**Cutoff Concentrations (ng/g)**
Buprenorphine	1	Amphetamine	5
Norbuprenorphine	0.5	Benzoylecgonine	1
		m-OH-Benzoylecgonine	1
Codeine	0.5	Cocaethylene	1
Dihydrocodeine	1	Cocaine	1
Fentanyl	0.5	MDMA (Ecstasy)	5
Hydrocodone	0.5	Methamphetamine	5
Norhydrocodone	1	Phentermine	8
Hydromorphone	0.5	Alprazolam	0.5
Meperidine	2	Alpha-OH-Alprazolam	0.5
Methadone	2	Butalbital	25
Methadone metabolite	1	Clonazepam	1
6-Acetylmorphine	1	7-Aminoclonazepam	1
Morphine	0.5	Diazepam	1
Naloxone	1	Lorazepam	5
Oxycodone	0.5	Midazolam	1
Noroxycodone	1	Alpha-OH-Midazolam	2
Oxymorphone	0.5	Nordiazepam	1
Noroxymorphone	0.5	Oxazepam	2
Propoxyphene	1	Phenobarbital	75
Tapentadol	2	Temazepam	1
Tramadol	2	Zolpidem	0.5
N-desmethyltramadol	2	Phencyclidine (PCP)	1
O-desmethyltramadol	2	Gabapentin	10

Interpretive Data:

Methodology: Qualitative Liquid Chromatography/Tandem Mass Spectrometry

Detection of drugs in umbilical cord tissue is intended to reflect maternal drug use during approximately the last trimester of a full-term pregnancy. The pattern and frequency of drug(s) used by the mother cannot be determined by this test. A negative result does not exclude the possibility that a mother used drugs during pregnancy. Detection of drugs in umbilical cord tissue depends on extent of maternal drug use, as well as drug stability, unique characteristics of drug deposition in umbilical cord tissue, and the performance of the analytical method. Drugs administered during labor and delivery may be detected. Detection of drugs in umbilical cord tissue does not insinuate impairment and may not affect outcomes for the infant. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Qualitative Liquid Chromatography-Tandem Mass Spectrometry

Drug Panel 9, Urine - Screen with Reflex to Confirmation/Quantitation

LAB6101

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Amphetamines, Urine
- Barbiturates, Urine
- Benzodiazepines, Urine
- CDASU 9 Comments
- Methadone, Urine
- Cocaine, Urine
- Creatinine, Urine
- Marijuana, Urine
- Opiates, Urine
- Pain Management
- Propoxyphene, Urine
- Phencyclidine, Urine
- LAB6101-VML
- LAB6101VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 8 mL urine with no additives or preservatives to ARUP Standard Transport Tubes. (Min: 4 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Amphetamines, Urine
- Barbiturates, Urine
- Benzodiazepines, Urine
- CDASU 9 Comments
- Methadone, Urine
- Cocaine, Urine
- Creatinine, Urine
- Marijuana, Urine
- Opiates, Urine
- Pain Management
- Propoxyphene, Urine
- Phencyclidine, Urine
- LAB6101-VML
- LAB6101VML

Ordering Recommendations:
Useful for general screening in contexts of compliance and/or abuse. A screen with reflex testing is the preferred method for ruling out drug exposure. This test does not distinguish between the delta-8 and delta-9 forms of THC or their metabolites.

Performed:
Sun-Sat

Methodology:
Qualitative Enzyme Multiplied Immunoassay Technique (EMIT)/Quantitative Gas Chromatography-Mass Spectrometry (GC-MS)/Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-4 days

Notes:

If the specimen screens positive, then Confirmation/Quantitation by GC/MS and/or LC-MS/MS will be added to confirm result. Additional charges apply.

To order testing for individual opioids, refer to Fentanyl and Metabolite - Confirmation/Quantitation - Urine (ARUP test code 0092570), Buprenorphine and Metabolites - Confirmation/Quantitation - Urine (ARUP test code 2010092), Meperidine and Metabolite Quantitative, Urine (ARUP test code 3000248), Tramadol and Metabolites - Confirmation/Quantitation - Urine (ARUP test code 2002736). For the comprehensive panel, refer to Pain Management Drug Panel by High-Resolution Time-of-Flight Mass Spectrometry and Enzyme Immunoassay, Urine (ARUP test code 2007479).

RESULTS INTERPRETATION

Reference Interval:

Drugs Covered and Cutoff Concentrations	
Drugs/Drug Classes	**Screen**
THC (Cannabinoids)	50 ng/mL
Cocaine	150 ng/mL
Opiates	300 ng/mL
Oxycodone	100 ng/mL
Phencyclidine	25 ng/mL
Amphetamines	300 ng/mL
MDMA (Ecstasy)	500 ng/mL
Barbiturates	200 ng/mL
Benzodiazepines	200 ng/mL
Methadone	150 ng/mL
Propoxyphene	300 ng/mL

Interpretive Data:

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration at which the screening test can detect a drug or metabolite varies within a drug class. Specimens for which drugs or drug classes are detected by the screen are reflexed to a second, more specific technology (GC/MS and/or LC-MS/MS). The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Oxycodone results are reported with the opiates results. MDMA results are reported with the amphetamines results. The following opioids are not detected in this test: fentanyl, buprenorphine, meperidine, tramadol, and tapentadol. A comprehensive panel that includes these opioids is available or individual opioid testing can be ordered. Refer to aruplab.com for test information.

For medical purposes only; not valid for forensic use.

Drug Screen 9 Panel, Serum or Plasma - Immunoassay Screen with Reflex to Mass Spectrometry Confirmation/Quantitation

LAB6050

ORDERING INFO

Collect:
Gray (sodium fluoride/potassium oxalate). Also acceptable: Plain red, green (sodium heparin), lavender (EDTA), or pink (K_2EDTA).

Synonyms:

- Pain Management
- LAB6050-VML
- LAB6050VML

SPECIMEN REQUIREMENTS

Collect:
Gray (sodium fluoride/potassium oxalate). Also acceptable: Plain red, green (sodium heparin), lavender (EDTA), or pink (K_2EDTA).

Specimen Preparation:
Remove plasma from cells ASAP or within 2 hours of collection. Transfer 4 mL plasma to an ARUP Standard Transport Tube. (Min: 3 mL) Also acceptable: Serum.

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles. Separator tubes. Plasma or whole blood collected in lt. blue (sodium citrate). Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 3 years

Performed:
Sun-Sat

Remarks:
Cocaine and cocaethylene are more stable in fluoride-preserved plasma than serum.

ORDERING

Synonyms:

- Pain Management
- LAB6050-VML
- LAB6050VML

Ordering Recommendations:
Use to monitor patient compliance. This test does not distinguish between the delta-8 and delta-9 forms of THC or their metabolites.

Performed:
Sun-Sat

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay (ELISA)/Quantitative Gas Chromatography-Mass Spectrometry (GC-MS)/Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-2 days

Notes:
Screen-positive specimens are automatically confirmed by GC/MS and/or LC-MS/MS; additional charges may apply.

RESULTS INTERPRETATION

Reference Interval:

Drugs Covered and Cutoff Concentrations	
Drugs/Drug Classes	**Screen**
Amphetamines	Effective August 17, 2020 20 ng/mL
Methamphetamine	Effective August 17, 2020 20 ng/mL
Barbiturates	Effective August 17, 2020 50 ng/mL
Benzodiazepines	Effective August 17, 2020 50 ng/mL
Buprenorphine	1 ng/mL
Cannabinoids	Effective August 17, 2020 20 ng/mL
Cocaine	Effective August 17, 2020 20 ng/mL
Methadone	Effective August 17, 2020 25 ng/mL
Opiates	Effective August 17, 2020 20 ng/mL
Oxycodone	Effective August 17, 2020 20 ng/mL
Phencyclidine	Effective August 17, 2020 10 ng/mL

Interpretive Data:

Drugs/Drug classes reported as "Positive" are automatically reflexed to mass spectrometry confirmation/quantitation. An unconfirmed positive immunoassay screen result may be useful for medical purposes but does not meet forensic standards. The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, or limitations of testing. The concentration at which the screening test can detect a drug or metabolite varies within a drug class. Specimens for which drugs or drug classes are detected by the screen are automatically reflexed to a second, more specific technology (GC/MS and/or LC-MS/MS). The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

For medical purposes only; not valid for forensic use.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

E-Cadherin (NCH-38) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath105

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- ECad

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Ordering Indicators:
N/A

Synonyms:

- ECad

Performed:
Monday-Friday

Turn Around Time:
2 Days

Methodology:
Immunohistochemical Stain

Components:
Stained slide and control

RESULTS INTERPRETATION

Reference Interval:
N/A

Interpretive Data:
N/A

Methodology:
Immunohistochemical Stain

ADDITIONAL INFORMATION

Section:
Histology

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Additional Information:
Complete VPLS Test Requisition. Request special requisition form No 60-002-664 if ordering on a regular basis. Package slides in durable slide holder and place with any block in padded envelope to protect from breaking.

Components:
Stained slide and control

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Synonyms:

Echovirus Antibodies

LAB3738

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plain Red.

Synonyms:

- Echovirus Ab Panel
- Echovirus Antibodies
- Echovirus antibody profile, IgG, IgM
- Echovirus Antibody, Neutralization
- Enterovirus
- LAB3738-VML
- LAB3738VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL) Parallel testing is preferred and convalescent samples must be received within 30 days from receipt of acute samples.

Unacceptable Conditions:
CSF or plasma. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon-Fri

Remarks:
Mark samples plainly as "acute" or "convalescent."

ORDERING

Synonyms:

- Echovirus Ab Panel
- Echovirus Antibodies
- Echovirus antibody profile, IgG, IgM
- Echovirus Antibody, Neutralization
- Enterovirus
- LAB3738-VML
- LAB3738VML

Ordering Recommendations:
PCR testing is preferred for diagnosis of acute infection. Detect neutralizing antibodies to echovirus types 6, 7, 9, 11, and 30.

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Serum Neutralization

Reported:
6-12 days

RESULTS INTERPRETATION

Reference Interval:
Echovirus 6: Less than 1:10
Echovirus 7: Less than 1:10
Echovirus 9: Less than 1:10
Echovirus 11: Less than 1:10
Echovirus 30: Less than 1:10

Interpretive Data:
Single positive antibody titers of greater than or equal to 1:80 may indicate past or current infection. Seroconversion or an increase in titers between acute and convalescent sera of at least fourfold is considered strong evidence of current or recent infection.

Methodology:
Semi-Quantitative Serum Neutralization

ADDITIONAL INFORMATION

CPT Codes:
86658 x5

Section:
RF-ARUP

Remarks:
Mark samples plainly as "acute" or "convalescent."

Ehrlichia and Anaplasma species by PCR

LAB3482

ORDERING INFO

Collect:

Blood: Lavender tube (EDTA); CSF: Sterile Container

Synonyms:

- LAB3482, EHD, Ehrlichia DNA, Anaplasma DNA, Ehrlichia/Anaplasma PCR
- LAB3482-VML
- LAB3482VML

Turn Around Time:

72 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Blood: Lavender tube (EDTA); CSF: Sterile Container

Specimen Preparation:

(Min 0.5mL Whole Blood), (Min 0.5mL CSF)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Blood: Ambient (15-25°C); CSF: Ambient (15-25°C)

Performed:

Tuesday, Thursday

Stability:

Blood: Up to 24 hours at Ambient (15-25°C), 3 days at Refrigerated (2-8°C). CSF: 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C), 4 weeks at Frozen(<=-20°C).

Specimen:

Blood in a Lavender tube (EDTA); CSF

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

Human ehrlichiosis is a tick-borne rickettsial disease of great public health concern in the United States. Clinical diagnosis of human ehrlichiosis has been difficult because its typical nonspecific presentation of symptoms include fever, headache, myalgias, arthralgias and nausea. This is easily confused with other illnesses such as influenza or other tick-borne zoonoses such as Lyme disease and gRocky Mountain spotted fever. This PCR assay for detection of ehrlichiosis makes it possible for early, specific diagnosis and treatment of this disease.

Synonyms:

- LAB3482, EHD, Ehrlichia DNA, Anaplasma DNA, Ehrlichia/Anaplasma PCR
- LAB3482-VML
- LAB3482VML

Performed:

Tuesday, Thursday

Turn Around Time:

72 hours

Methodology:

PCR (Polymerase Chain Reaction)

Components:

None

RESULTS INTERPRETATION

Reference Interval:

Not Detected

Interpretive Data:

A negative result does not rule out the presence of PCR inhibitors in the patient specimen or test-specific nucleic acid in concentrations below the level of detection by this test. This test was developed and its performance characteristics determined by VML Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

PCR (Polymerase Chain Reaction)

Electrolyte Panel, Plasma or Serum

LAB16

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- ELY, Electrolytes, Electrolytes Panel, LAB16
- LAB16-VML
- LAB16VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.3 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 7 days; 2° to 8°C: 7 days

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:

Electrolytes, Fecal

LAB388

ORDERING INFO

Collect:
24-hour or random liquid stool.

Synonyms:

- Electrolytes, Feces
- Fecal Electrolytes
- LAB388-VML
- LAB388VML

SPECIMEN REQUIREMENTS

Collect:
24-hour or random liquid stool.

Specimen Preparation:
Mix well and transfer a 5 g aliquot of stool to an unpreserved stool transport vial (ARUP Supply #40910). Available online through eSupply using ARUP Connect(TM) or contact Client Services at (800) 522-2787. (Min: 1 g) Do not add saline or water to liquefy specimen.

Unacceptable Conditions:
Formed or viscous stool.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun-Sat

Endomysial Antibody, IgA by IFA

LAB774

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Anti-Endomysial Antibodies
- EMA
- EMA IgA
- Gluten-Sensitive Enteropathy Tests
- LAB774-VML
- LAB774VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Unacceptable Conditions:
Plasma. Severely lipemic, contaminated, or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid freeze/thaw cycles)

Performed:
Mon-Fri

ORDERING

Synonyms:

- Anti-Endomysial Antibodies
- EMA
- EMA IgA
- Gluten-Sensitive Enteropathy Tests
- LAB774-VML
- LAB774VML

Ordering Recommendations:
Not recommended as an initial test to evaluate for suspected celiac disease (CD). May be used to evaluate for suspected CD in individuals with positive results for tissue transglutaminase (tTG) IgA.The preferred test to screen for CD is Celiac Disease Reflexive Cascade, Serum (3016817).

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Less than 1:10

Interpretive Data:
The endomysial antigen has been identified as the protein cross-linking enzyme known as tissue transglutaminase.

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

- IgA Deficient Celiac Disease
- LAB3739-VML
- LAB3739VML

Ordering Recommendations:
Not recommended as an initial test to evaluate for suspected celiac disease (CD). The preferred test to screen for CD is Celiac Disease Reflexive Cascade, Serum (3016817).

Performed:
Tue, Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 14, 2011

Less than 1:10

Interpretive Data:
The presence of endomysial antibodies IgG, may be useful in identifying IgA-deficient patients at risk for celiac disease. To establish the diagnosis of celiac disease, a positive result must be confirmed through a biopsy of the small intestine.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Epstein-Barr Antibody Panel, serum

LAB863

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB863, EBB, EBV
- LAB863-VML
- LAB863VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used as an aid in the diagnosis of infectious mononucleosis.

Synonyms:

- LAB863, EBB, EBV
- LAB863-VML
- LAB863VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
Capsid IgG, Capsid IgM, Nuclear IgG

RESULTS INTERPRETATION

Reference Interval:
Capsid IgG: Negative, Nuclear Antibody: Negative, Capsid IgM: Negative

Interpretive Data:
See Table 4

Methodology:
Multiplex Flow Immunoassay

Epstein-Barr Virus (EBV) by Quantitative PCR

LAB1373

ORDERING INFO

Collect:

Blood: Plasma Preparation Tube (PPT) (EDTA); CSF: Sterile Container

Synonyms:

- LAB1373, Epstein Barr Virus, EBQ, EBV DNA quant
- LAB1373-VML
- LAB1373VML

Turn Around Time:

72 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Blood: Plasma Preparation Tube (PPT) (EDTA); CSF: Sterile Container

Specimen Preparation:

Blood: draw 4.0ml of whole blood (Lavender tube [EDTA]), deliver to lab within 24hrs at Ambient (15-25°C). CSF: Collect in sterile container and deliver to lab within 24hrs at Ambient (15-25°C) (Min 0.5mL Plasma), (Min 0.5mL CSF)

Pediatric Collection:

Lavender microtainer (EDTA)

Storage/Transport Temperature:

Blood: Ambient (15-25°C); CSF: Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Blood: Up to 24 hours at Ambient (15-25°C), 6 days at Refrigerated (2-8°C) once spun and plasma separated. CSF: 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C), 4 weeks at Frozen (<=-20°C).

Specimen:

Blood in a Lavender tube (EDTA); CSF

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
EBV has been implicated as a cause of lymphoproliferative diseases in immunocompromised patients, including post-transplant lymphoproliferative disorders (PTLDs). PTLDs cause a high rate of mortality in transplant recipients. Quantitation of the systemic EBV load may provide a highly sensitive and specific method to predict the development and monitoring of EBV disease.

Synonyms:

- LAB1373, Epstein Barr Virus, EBQ, EBV DNA quant
- LAB1373-VML
- LAB1373VML

Performed:
Monday - Friday

Turn Around Time:
72 hours

Methodology:
PCR (Polymerase Chain Reaction)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
The quantitative range of this test is 1.54-8.00 log IU/mL (35.0-100,000,000 IU/mL). An interpretation of "Not Detected" does not rule out the presence of inhibitors or EBV DNA concentration below the level of detection of the assay. Care should be taken in the interpretation of any single viral load determination. International standardization has improved comparability of assay results across laboratories, but discrepancies still exist due to commutability issues with the standard.

Methodology:
PCR (Polymerase Chain Reaction)

ADDITIONAL INFORMATION

Section:
Molecular Infectious Disease

Epstein-Barr Virus Antibody to Viral Capsid Antigen, IgA

LAB1732

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- EBV Antibodies
- Infectious Mononucleosis
- EBV VCA-IgA Ab
- LAB1732-VML
- LAB1732VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimen plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated or heat-inactivated specimens. Grossly hemolytic, icteric or, lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 30 days

Performed:
Tue

ORDERING

Synonyms:

- EBV Antibodies
- Infectious Mononucleosis
- EBV VCA-IgA Ab
- LAB1732-VML
- LAB1732VML

Ordering Recommendations:
Do not use to diagnose Epstein-Barr virus infectious mononucleosis. May aid in the detection and prognosis of nasopharyngeal carcinoma.

Performed:
Tue

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 15, 2021

Reference Interval	
8 U or less	Not Detected
9-11 U	Indeterminate - Repeat testing in 10-14 days may be helpful.
12 U or greater	Detected

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Erythropoietin

LAB873

ORDERING INFO

Collect:
Serum separator tube or plasma separator tube.

Synonyms:

- EPO (Erythropoietin)
- Epogen
- EPO
- Hemopoietin
- Hematopoietin
- LAB873-VML
- LAB873VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plasma separator tube.

Specimen Preparation:
Allow serum to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Bone marrow aspirate. EDTA plasma. Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 1 week; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- EPO (Erythropoietin)
- Epogen
- EPO
- Hemopoietin
- Hematopoietin
- LAB873-VML
- LAB873VML

Ordering Recommendations:
Initial screening test for evaluation of polycythemia. Determine eligibility for erythropoietin therapy in anemia due to chronic renal failure.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Normal serum concentrations of erythropoietin for 95% of individuals with normal hematocrits range from 4-27 mU/mL.

As the hematocrit is lowered by iron deficiency, aplastic or hemolytic anemia, the concentration of erythropoietin increases as shown in the graph below. In the absence of anemia, elevated concentrations are seen in renal tumors, as a manifestation of renal transplant rejection, and in secondary polycythemia. Low values may be observed in hemochromatosis.

Decreased erythropoietin concentrations with an elevated hematocrit are observed in patients with polycythemia rubra vera, and with a decreased hematocrit in patients with HIV infection who are receiving AZT. Patients on AZT who have anemia and erythropoietin concentrations of less than or equal to 500 mU/mL, may benefit from therapy with recombinant EPO (NEJM 322:1488-1493, 1990).

EXPECTED ERYTHROPOIETIN CONCENTRATIONS IN PATIENTS WITH UNCOMPLICATED ANEMIA

Collect:

Serum separator tube or plasma separator tube.

Specimen Preparation:

Allow serum to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:

Bone marrow aspirate. EDTA plasma. Hemolyzed specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 8 hours; Refrigerated: 1 week; Frozen: 2 months

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- EPO (Erythropoietin)
- Epogen
- EPO
- Hemopoietin
- Hematopoietin
- LAB873-VML
- LAB873VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
Within 24 hours

Ordering Recommendations:
Initial screening test for evaluation of polycythemia. Determine eligibility for erythropoietin therapy in anemia due to chronic renal failure.

Reference Interval:
Normal serum concentrations of erythropoietin for 95% of individuals with normal hematocrits range from 4-27 mU/mL.

As the hematocrit is lowered by iron deficiency, aplastic or hemolytic anemia, the concentration of erythropoietin increases as shown in the graph below. In the absence of anemia, elevated concentrations are seen in renal tumors, as a manifestation of renal transplant rejection, and in secondary polycythemia. Low values may be observed in hemochromatosis.

Decreased erythropoietin concentrations with an elevated hematocrit are observed in patients with polycythemia rubra vera, and with a decreased hematocrit in patients with HIV infection who are receiving AZT. Patients on AZT who have anemia and erythropoietin concentrations of less than or equal to 500 mU/mL, may benefit from therapy with recombinant EPO (NEJM 322:1488-1493, 1990).

ESOPHAGEAL BRUSH CYTOLOGY

esob, bdbr

ORDERING INFO

Collect:
Clean specimen container filled with saline or RPMI and cytobrush.

Synonyms:

- Esophageal brushing, Bile duct brushing

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container filled with saline or RPMI and cytobrush.

Specimen Preparation:
1. Esophageal cells are collected on a cytobrush and immediately placed in either a saline or RPMI container (min 1 mL). 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: Obtain as much as clinical judgement allows)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours. Some specimens may have fixative added if specimen cannot be delivered within 2 hours and cannot be Refrigerated: (2-8°C) during transport. Call lab for assistance at 615-322-2721.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Material brushed from esophagus in saline or RPMI.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc.

Synonyms:

- Esophageal brushing, Bile duct brushing

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Methodology:
ThinPrep procedure

ADDITIONAL INFORMATION

Section:
Cytology

Alternate Specimen:
N/A

Additional Information:
GMS stain can be ordered to rule out Candida.

Estradiol, Serum (Adult Premenopausal Females or Individuals on Estrogen Hormone Therapy)

LAB523

ORDERING INFO

Collect:
Gold (Clot Activator with Gel)

Synonyms:

- E2, Estradiol Level, LAB523
- LAB523-VML
- LAB523VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Samples should not be taken from patients taking biotin until at least 8 hours following the last dose.

Collect:
Gold (Clot Activator with Gel)

Specimen Preparation:
Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP (Min 0.4 mL). WARNING: Do NOT order on patients on fulvestrant therapy due to significant cross reactivity. Consider alternate testing method.

Pediatric Collection:
1 Gold Microtainer (Clot Activator with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 24 hours; 2° to 8°C: 2 days; Frozen: 6 months

Estrogens, Fractionated, by Mass Spectrometry

LAB980

ORDERING INFO

Collect:
Serum separator tube, lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Synonyms:

- Total Estrogens
- Estrone (E1) and Estradiols (E2)
- LAB980-VML
- LAB980VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube, lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min 0.3 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Total Estrogens
- Estrone (E1) and Estradiols (E2)
- LAB980-VML
- LAB980VML

Ordering Recommendations:
Use to evaluate estrogen status in children, cisgender males, and postmenopausal cisgender females. Most useful when low estrogen concentrations are expected, regardless of the patient's sex assigned at birth.To compare this test to other estrogen tests, refer to the ARUP Estrogen Tests Comparison table.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Synonyms:

- Estrone (E1)
- LAB982-VML
- LAB982VML

Ordering Recommendations:
Rarely indicated in clinical practice. The preferred test for the measurement of estrone is Estrogens, Fractionated, by Mass Spectrometry (0093248).

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval		
Estrone by Mass Spec	**Age**	**Male (pg/mL)**	**Female (pg/mL)**
	7-9 years	Less than 7.0	Less than 20.0
	10-12 years	Less than 11.0	1.0-40.0
	13-15 years	1.0-30.0	8.0-105.0
	16-17 years	1.0-32.0	4.0-133.0
	18 years and older	9.0-36.0	Premenopausal Early Follicular: Less than 150.0 Late Follicular: 100.0-250.0. Luteal: Less than 200.0 Postmenopausal: 3.0-32.0
	Tanner Stage I	Less than 7.0	Less than 27.0
	Tanner Stage II	Less than 11.0	1.0-39.0
	Tanner Stage III	1.0-31.0	8.0-117.0
	Tanner Stage IV-V	2.0-30.0	4.0-109.0

Interpretive Data:

For a complete set of all established reference intervals, refer to ltd.aruplab.com/Tests/Pub/0093249.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Ethanol, Plasma or Serum

LAB46

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- Ethanol, ETH, Blood alcohol, Ethanol Level, LAB46
- LAB46-VML
- LAB46VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation (Min 0.3 mL). Cap tube tightly to minimize alcohol loss. When drawing a blood specimen for alcohol testing, use a nonalcohol-based cleanser at the venipuncture site.

Pediatric Collection:
1 Dark Green Microtainer (Sodium Heparin)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 2 weeks; 2° to 8°C: 6 months; Frozen: 6 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

Ethosuximide, Serum or Plasma

LAB6445

ORDERING INFO

Collect:
Plain Red. Also acceptable: Lavender (K_2or K_3EDTA) or Pink (K_2EDTA).

Synonyms:

- Zarontin
- LAB6445-VML
- LAB6445VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain Red. Also acceptable: Lavender (K_2or K_3EDTA) or Pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 5 days; Refrigerated: 1 week; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Zarontin
- LAB6445-VML
- LAB6445VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme Immunoassay

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Ethosuximide	40-100 µg/mL

Interpretive Data:
The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Toxic concentrations may cause dizziness, drowsiness and anorexia. The incidence of adverse reactions is low; however, life-threatening agranulocytosis and fatal pancytopenia have been reported.

Components	Interpretive Data
Ethosuximide	Toxic: > 150 µg/mL

Methodology:
Quantitative Enzyme Immunoassay

Ethylene Glycol, plasma

LAB714

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- LAB714, EG, Antifreeze
- LAB714-VML
- LAB714VML

Turn Around Time:
6 hours after sample received in lab

SPECIMEN REQUIREMENTS

Patient Preparation:
A non-alcohol based cleanser should be used to clean the venipuncture site prior to collection.

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Specimens should be delivered to the lab immediately and should be centrifuged and separated within 2 hours of collection. (Minimum 0.5 mL plasma)

Pediatric Collection:
Dark green microtainer (Sodium heparin)

Storage/Transport Temperature:
Refrigerated (2-8°C) if not delivered to the lab immediately

Performed:
Daily

Stability:
After separation from cells: Refrigerated (2-8°C): 14 days

Specimen:
Plasma

Alternate Specimen:
Gray tube (Sodium fluoride) or red tube (no gel)

ORDERING

Ordering Indicators:
This test is used to aid in the diagnosis of antifreeze consumption.

Synonyms:

- LAB714, EG, Antifreeze
- LAB714-VML
- LAB714VML

Performed:
Daily

Turn Around Time:
6 hours after sample received in lab

Methodology:
GC/FID

Components:
Ethylene glycol, 1,2-propanediol

RESULTS INTERPRETATION

Reference Interval:
None detected (< 5 mg/dL)

Interpretive Data:
Because the manifestation of ethylene glycol toxicity is often delayed, patients tend to present late, by which time a large proportion of the ethylene glycol may already have been metabolized. It may be difficult to correlate serum ethylene glycol concentrations with severity of poisoning. 1,2-propanediol is used as a vehicle for a number of drugs and significant concentrations may be found in blood samples from patients who have been treated with intravenous drug preparations.

Methodology:
GC/FID

ADDITIONAL INFORMATION

Section:
Special Chemistry

Alternate Specimen:
Gray tube (Sodium fluoride) or red tube (no gel)

Additional Information:
This test includes qualitative measurement of 1,2-propanediol.

Components:
Ethylene glycol, 1,2-propanediol

Resulting Laboratory:
Vanderbilt Medical Laboratories

Euglobulin Clot Lysis Time

LAB1117

ORDERING INFO

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Synonyms:

- LAB1117, ELT
- LAB1117-VML
- LAB1117VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: Two 2.7 mL Light blue tubes (3.2% Sodium Citrate); Neonatal: Two 1.8mL Light blue tubes (3.2% Sodium Citrate)

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Monday - Friday

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
The euglobulin lysis time is a screening test for hyperfibrinolysis. It should be considered when a patient demonstrates a bleeding phenotype (e.g. bleeding assessment score of > 5) and other, more common, bleeding disorders have been ruled out.

Synonyms:

- LAB1117, ELT
- LAB1117-VML
- LAB1117VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 days

Methodology:
Clot lysis

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
> 2.0 hours

Interpretive Data:
A fibrinogen level of < 80 mg/dL or an elevated level of circulating fibrin degradation products may cause a false positive result (lysis of clot in less than 2 hours).

Methodology:
Clot lysis

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Performed Monday - Friday from 7:00 AM to 1:00 PM. The sample must by received in the laboratory by 12:00 PM for same day testing.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Two Light blue tubes (3.2% Sodium Citrate)

Everolimus by Tandem Mass Spectrometry

LAB3740

ORDERING INFO

Collect:
Lavender (EDTA) or pink (K2EDTA).

Synonyms:

- Certican
- Everolimus, Blood
- Zortress
- Afinitor
- LAB3740-VML
- LAB3740VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Predose (trough) levels should be drawn.

Collect:
Lavender (EDTA) or pink (K2EDTA).

Specimen Preparation:
Transport 1 mL whole blood. (Min: 0.25 mL)

Unacceptable Conditions:
Serum or plasma. Specimens left at room temperature for longer than 24 hours. Clotted specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 2 weeks; Frozen: 2 weeks

Performed:
Sun-Sat

ORDERING

Synonyms:

- Certican
- Everolimus, Blood
- Zortress
- Afinitor
- LAB3740-VML
- LAB3740VML

Ordering Recommendations:
Use to optimize dosing and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-2 days

Notes:
Everolimus (Zortress, Certican, Afinitor) whole blood concentrations can be measured by either chromatographic or immunoassay methodologies. These two methodologies are not directly interchangeable, and the measured everolimus whole blood concentration depends on the methodology used, and reference ranges may vary according to specific immunoassay or HPLC/MS/MS test. Generally, immunoassays have been reported to have a positive test bias relative to HPLC-MS/MS assays, due to the detection of antibody cross-reactivity with everolimus metabolites.

RESULTS INTERPRETATION

Reference Interval:

Effective February 18, 2014

	Therapeutic Range:
Kidney transplant (in combination with Cyclosporine):	3-8 ng/mL
Liver transplant (in combination with Tacrolimus):	3-8 ng/mL
Toxic value:	Greater than 15 ng/mL

Interpretive Data:

Everolimus marketed as Zortress is FDA approved for prophylaxis of organ rejection in adult patients receiving a kidney and liver transplant.

Everolimus marketed as Afinitor is FDA approved for the treatment of renal cell carcinoma and for the treatment of subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis (TS) in patients who are not candidates for curative surgical resection. The suggested therapeutic range for treatment of SEGA is 5-15 ng/mL, which is based on a predose (trough) specimen.

The optimal therapeutic range for a given patient may differ from this suggested range based on the indication for therapy, treatment phase (initiation or maintenance), use in combination with other drugs, time of specimen collection relative to prior dose, type of transplanted organ, and/or the therapeutic approach of the transplant center.

Methodology:

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

7-18 days

Notes:
Antibodies: Mi-2, PL-7, PL12, P155/140, EJ, Ku, OJ, PM/Scl, SRP, Smith/RNP, Ro52, Ro60, Jo-1, U3 Fib, SAE1, NXP2, MDA5, TIF1-gamma

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Smith/RNP (ENA) Ab, IgG	19 Units or less
SSA-52 (Ro52) (ENA) Antibody, IgG	40 AU/mL or less
Jo-1 (Histidyl-tRNA Synthetase) Ab, IgG	40 AU/mL or less
PM/Scl 100 Antibody, IgG	Negative
Mi-2 (nuclear helicase protein) Antibody	Negative
PL-7 (threonyl-tRNA synthetase) Antibody	Negative
PL-12 (alanyl-tRNA synthetase) Antibody	Negative
P155/140 Antibody	Negative
EJ (glycyl-tRNA synthetase) Antibody	Negative
Ku Antibody	Negative
SRP (Signal Recognition Particle) Ab	Negative
OJ (isoleucyl-tRNA synthetase) Antibody	Negative
SSA-60 (Ro60) (ENA) Antibody, IgG	40 AU/mL or less
Fibrillarin (U3 RNP) Ab, IgG	Negative
SAE1 (SUMO activating enzyme) Ab	Negative
MDA5 (CADM-140) Ab	Negative
NXP2 (Nuclear matrix protein-2) Ab	Negative
TIF-1 gamma (155 kDa) Ab	Negative

Interpretive Data:

Refer to report.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
SSA-52 (Ro52) (ENA) Antibody, IgG	29 AU/mL or Less: Negative 30-40 AU/mL: Equivocal 41 AU/mL or greater: Positive
SSA-60 (Ro60) (ENA) Antibody, IgG	29 AU/mL or Less: Negative 30-40 AU/mL: Equivocal 41 AU/mL or greater: Positive
Smith/RNP (ENA) Antibody, IgG	19 Units or less Negative 20-39 Units Weak Positive 40-80 Units Moderate Positive 81 Units or greater Strong Positive
Jo-1 Antibody, IgG	29 AU/mL or less Negative 30-40 AU/mL Equivocal 41 AU/mL or greater Positive

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay/Qualitative Immunoprecipitation/Semi-Quantitative Multiplex Bead Assay/Qualitative Immunoblot

ADDITIONAL INFORMATION

CPT Codes:

83516 x8; 86235 x6; 84182 x4

FULL VIEW

Collect:
Serum separator tube (SST), red top tube

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer three 1 mL serum aliquots to ARUP Standard Transport Tubes. (Min: 0.5 mL/aliquot)

Unacceptable Conditions:
Hemolyzed, hyperlipemic, icteric, heat-treated or contaminated specimens.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- LAB6020-VML
- LAB6020VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
7-18 days

Ordering Recommendations:
May be useful for differential evaluation of polymyositis, dermatomyositis, necrotizing autoimmune myopathy, or overlap syndromes associated with connective tissue disease.

Interpretive Data:
Refer to report.

Extended Phenotype (Red Blood Cell), blood

LAB3006

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- Extended Patient Phenotype, EXPHE,
- LAB3006-VML
- LAB3006VML

Turn Around Time:
1 day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Refer to SOP: Labeling of Laboratory Specimens section III.C. for labeling requirements specific to Blood Bank Specimens.

Pediatric Collection:
Pediatric Lavendar tube (EDTA) Lavendar microtainer (EDTA)

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Ambient: (15-25°C): 3 days

Specimen:
Blood

Alternate Specimen:
Red tube (no gel)

ORDERING

Ordering Indicators:
Red Cell typing may be used for bone marrow or tissue donations, deteremine corresponding maternal/fetal antigens in HDFN

Synonyms:

- Extended Patient Phenotype, EXPHE,
- LAB3006-VML
- LAB3006VML

Performed:
Daily

Turn Around Time:
1 day

Methodology:
Agglutination

Components:
Red Cell antigen typing for C/c, E/e,Kell, Fya/Fyb, Jka/Jkb, and S/s

RESULTS INTERPRETATION

Reference Interval:
NA

Interpretive Data:
NA

Methodology:
Agglutination

ADDITIONAL INFORMATION

F-Actin (Smooth Muscle) IgG, serum

LAB826

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB826, F-Actin, ASMA, SMA, Smooth Muscle Antibody
- LAB826-VML
- LAB826VML

Turn Around Time:
1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Ambient (15-25°C): 8 hours, Refrigerated (2-8°C): 48 hours

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used to evaluate patients with chronic liver disease in whom the diagnosis of chronic active autoimmune hepatitis is suspected

Synonyms:

- LAB826, F-Actin, ASMA, SMA, Smooth Muscle Antibody
- LAB826-VML
- LAB826VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
Enzyme-linked Immunoassay

Components:
F-Actin Ab IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result indicates the presence of actin antibodies and suggests the possibility of autoimmune hepatitis (AIH). A negative result does not rule out AIH.

Methodology:
Enzyme-linked Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Additional Information:
NA

Components:
F-Actin Ab IgG

Resulting Laboratory:

Factor II Activity

LAB303

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB303, F2, F2 Activity
- LAB303-VML
- LAB303VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB303, F2, F2 Activity
- LAB303-VML
- LAB303VML

Performed:
Daily

Turn Around Time:
1 - 3 days

Methodology:
Clotting

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
50 - 150%

Interpretive Data:
Direct thrombin (IIa) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. The presence of a strong lupus anticoagulant may interfer with the assay. Patients on warfarin may have lower than expected levels of factor II.

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
The factor II activity assay is not a test for Prothrombin G20210A gene mutation. Testing is performed daily from 7:00AM to 4:00PM. The sample must be in the lab by 3:00 PM for same day testing. After hours testing must be approved by the Coagulation Laboratory Medical Director on-call (refer to Synergy for contact information).

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

RESULTS INTERPRETATION

Reference Interval:
50 -150%

Interpretive Data:
Direct thrombin (IIa) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. The presence of a strong lupus anticoagulant may interfer with the assay. Hemlibra (emicizumab) interfers with the clot-based factor IX activity assay. Clot-based factor IX results on patients receiving Hemlibra will be higher than expected. (DOI: 10.1111/hae.13903).

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
When ordering a factor IX activity and factor IX inhibitor, collect two 2.7 mL or three 1.8 mL light blue tubes (3.2% Sodium Citrate). Testing is performed daily for 7:00AM to 4:00PM. Samples must be received in the laboratory by 2:00PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call (refer to Synergy for contact information).

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:
Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:
Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Preferred Collection Volume:
Fill all tubes to indicator line.

Alternate Specimen:
N/A

Patient Preparation:
Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Specimen:
Citrated platelet poor plasma .

Reasons for Rejection:
Incorrect tube type, clotted, incorrect fill volume, received on ice, grossly hemolyzed, grossly icteric, grossly lipemic. Whole blood > 4 hours after collection. Thawed plasma aliquots.

Components:
N/A

Stability:
Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Methodology:
Direct detection of F5 variant c.1601G>A (p.R506Q) by Taqman® SNP genotyping assay; Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
In the US, heterozygosity for the F5 variant is present in approximately 5% of Caucasians, 2.2% of Hispanics and 1.2% of African Americans; overall, roughly 1 in 5,000 individuals are homozygous for the variant. In addition, the F5 variant is the most common inherited risk factor for venous thromboembolism in the US. Population based studies have shown that F5 increases the risk of a first VTE 4- to 7-fold in heterozygous individuals and 40- to 80-fold in homozygous individuals. This is a targeted assay and is specific for the identification of the c.1601G>A (p.R506Q) variant; therefore, it cannot exclude the presence of other variants in the F5 gene. These results should be correlated with other laboratory and clinical findings.

Methodology:
Direct detection of F5 variant c.1601G>A (p.R506Q) by Taqman® SNP genotyping assay; Laboratory Developed Test

Performed:
Tuesday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
10 days

Ordering Indicators:
Used to assess individuals at risk of or presenting with venous thromboembolism (VTE).

Interpretive Data:
In the US, heterozygosity for the F5 variant is present in approximately 5% of Caucasians, 2.2% of Hispanics and 1.2% of African Americans; overall, roughly 1 in 5,000 individuals are homozygous for the variant. In addition, the F5 variant is the most common inherited risk factor for venous thromboembolism in the US. Population based studies have shown that F5 increases the risk of a first VTE 4- to 7-fold in heterozygous individuals and 40- to 80-fold in homozygous individuals. This is a targeted assay and is specific for the identification of the c.1601G>A (p.R506Q) variant; therefore, it cannot exclude the presence of other variants in the F5 gene. These results should be correlated with other laboratory and clinical findings.

Reference Interval:
Not detected

Additional Information:
Laboratory Developed Test

Methodology:
Direct detection of F5 variant c.1601G>A (p.R506Q) by Taqman® SNP genotyping assay; Laboratory Developed Test

LAB305

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB305, F7
- LAB305-VML
- LAB305VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection. Do not refirgerate whole blood or plasma aliquot.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Direct thrombin (IIa) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. The presence of a strong lupus anticoagulant may interfer with the assay. Patients on warfarin may have lower than expected levels of factor X.

Reference Interval:
50 - 150%

Additional Information:
Performed daily from 7:00 AM to 4:00 PM. Sample must be received in the laboratory by 3:00 PM for same day testing. After hours testing must be approved by the Coagulation Laboratory Medical Direct on-call (refer to Synergy for contact information).

Methodology:
Clotting

Coagulation

Factor X Inhibitor

LAB3436

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB3436, 10I, Factor 10 Inhibitor, 10IN
- LAB3436-VML
- LAB3436VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Monday, Wednesday, and Friday.

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

Factor XIII Screen

LAB1113

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB1113, F13, Factor 13 Screen
- LAB1113-VML
- LAB1113VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

The factor XIII screen differentiates between severe (<5%) and non-severe (>5%) factor XIII activity only. If a quantitative value is desired please order a factor XIII activity assay.

Synonyms:

- LAB1113, F13, Factor 13 Screen
- LAB1113-VML
- LAB1113VML

Performed:
Daily

Turn Around Time:
1 - 3 days

Methodology:
Urea Clot Solubility

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Normal

Interpretive Data:
Low levels of fibrinogen or an abnormal fibrinogen may interfer with the assay. A factor XIII level of 1 to 2% of normal is adequate to stablize a clot for 24 hours. A normal factor XIII screen does not exclude the possibility of a mild heterzyous deficiency.

Methodology:
Urea Clot Solubility

Low levels of fibrinogen or an abnormal fibrinogen may interfer with the assay. A factor XIII level of 1 to 2% of normal is adequate to stablize a clot for 24 hours. A normal factor XIII screen does not exclude the possibility of a mild heterzyous deficiency.

Reference Interval:
Normal

Additional Information:
Performed daily from 7:00 AM to 4:00 PM. Sample must be received in the laboratory by 2:00 PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call (refer to Synergy for contact information).

Methodology:
Urea Clot Solubility

Section:
Coagulation

Fat, Fecal Qualitative

LAB390

ORDERING INFO

Collect:
Random stool.

Synonyms:

- Fatty Acid, Stool
- Fecal Fat Stain
- Neutral Fat, Stool
- Qualitative Fat
- Qualitative Stool Fat
- random fecal fat
- random stool lipids
- Stool Lipids
- Sudan III Stain, Stool
- LAB390-VML
- LAB390VML

SPECIMEN REQUIREMENTS

Collect:
Random stool.

Specimen Preparation:
Transfer 5 g stool to an unpreserved stool transport vial (ARUP supply #40910). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 g)

Unacceptable Conditions:
Diapers. Specimens in media or preservatives.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: 2 weeks; Frozen: 2 weeks

Performed:
Sun-Sat

ORDERING

Synonyms:

- Fatty Acid, Stool
- Fecal Fat Stain
- Neutral Fat, Stool
- Qualitative Fat
- Qualitative Stool Fat
- random fecal fat
- random stool lipids
- Stool Lipids
- Sudan III Stain, Stool
- LAB390-VML
- LAB390VML

Performed:
Sun-Sat

Methodology:
Qualitative Microscopy/Stain

Reported:
1-2 days

RESULTS INTERPRETATION

Reference Interval:
Normal

Interpretive Data:
Neutral fats include the monoglycerides, diglycerides, and triglycerides while split fats are the free fatty acids that are liberated from them. Impaired synthesis or secretion of pancreatic enzymes or bile may cause an increase in neutral fats while an increase in split fats suggests impaired absorption of nutrients.

Methodology:
Qualitative Microscopy/Stain

Fat, Fecal Quantitative 24-Hour Collection (Includes Homogenization)

LAB392

ORDERING INFO

Collect:
24-hour stool. Refrigerate during collection. Provide patient a Timed Stool Collection Kit (ARUP supply #44192) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787.

Synonyms:

- Fecal fat 24 Hour
- LAB392-VML
- LAB392VML

SPECIMEN REQUIREMENTS

Patient Preparation:
The patient should be on a diet consisting of 50 to 150 g of fat per day for 3 days prior to the study. Non-absorbable fat substitutes, such as olestra, should be avoided prior to collection.

Collect:
24-hour stool. Refrigerate during collection. Provide patient a Timed Stool Collection Kit (ARUP supply #44192) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787.

Specimen Preparation:
Refer to instructions in Stool Collection-Timed Specimens (24, 48, 72 Hours) under Specimen Handling at http://www.aruplab.com. Submit entire 24-hour stool collection in an ARUP approved transport container(s) provided in kit using additional containers as needed for the full collection (available separately, ARUP supply #28077). (Min: 4 g)

Unacceptable Conditions:
Random collections. Specimens containing barium or charcoal. Specimens in media or preservatives. Containers larger than 500 mL (500 g), such as paint cans, will be rejected and discarded.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: 4 days; Frozen: 2 weeks

Performed:
Sun-Sat

ORDERING

Synonyms:

- Fecal fat 24 Hour
- LAB392-VML
- LAB392VML

Ordering Recommendations:
Measurement of fecal fats can be useful in establishing a diagnosis of pancreatic disease. Testing requires the submission of an entire 24-hour stool collection. For random stool collections, order Fat, Fecal Qualitative (0020385). For testing of an aliquot from a 24-, 48-, or 72-hour stool collection, order Fat, Fecal Quantitative, Homogenized Aliquot (2002350). For complete 48-hour stool collections, order Fat, Fecal Quantitative, 48-Hour Collection (Includes Homogenization) (2002355). For complete 72-hour stool collections, order Fat, Fecal Quantitative, 72-Hour Collection (Includes Homogenization) (2002356).

Performed:
Sun-Sat

Methodology:
Nuclear Magnetic Resonance Spectroscopy

Reported:
2-3 days

RESULTS INTERPRETATION

Reference Interval:
0-5 years: 0.0-2.0 g/24h
6 years and older: 0.0-6.0 g/24h

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Ordering Recommendations:

Preferred molecular test to confirm or rule out a diagnosis of a fatty acid oxidation disorder following clinical and/or biochemical presentation. Also refer to Acylcarnitine Quantitative Profile, Plasma (0040033), Carnitine Panel (0081110), and Organic Acids, Urine (0098389).

Performed:

Varies

Methodology:

Massively Parallel Sequencing

Reported:
10-15 days

Notes:
Genes tested: ACAD9, ACADM, ACADS, ACADVL, ACAT1, CPT1A, CPT2, ECHS1, ETFA, ETFB, ETFDH, FLAD1, HADH, HADHA, HADHB, HMGCL, HMGCS2, HSD17B10, LPIN1*, MLYCD, SLC22A5, SLC25A20, SLC52A1, SLC52A2, SLC52A3.
*One or more exons are not covered by sequencing for the indicated gene; see Additional Technical Information

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Refer to report.

This test was developed, and its performance characteristics determined, by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Performed:
Varies

Resulting Laboratory:
ARUP Laboratories

Reported:
10-15 days

Ordering Recommendations:
Preferred molecular test to confirm or rule out a diagnosis of a fatty acid oxidation disorder following clinical and/or biochemical presentation. Also refer to Acylcarnitine Quantitative Profile, Plasma (0040033), Carnitine Panel (0081110), and Organic Acids, Urine (0098389).

Interpretive Data:
Refer to report.

This test was developed, and its performance characteristics determined, by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Reference Interval:
By report

Methodology:
Massively Parallel Sequencing

Section:
RF-ARUP

CPT Codes:
81404; 81405; 81406; 81479

Notes:
Genes tested: ACAD9, ACADM, ACADS, ACADVL, ACAT1, CPT1A, CPT2, ECHS1, ETFA, ETFB, ETFDH, FLAD1, HADH, HADHA, HADHB, HMGCL, HMGCS2, HSD17B10, LPIN1*, MLYCD, SLC22A5, SLC25A20, SLC52A1, SLC52A2, SLC52A3.

Fatty Acids, Free

LAB986

ORDERING INFO

Collect:
Serum Separator Tube (SST). Collect on ice.

Synonyms:

- FFA
- Free Fatty Acids
- Free Fatty Acids, Serum
- NEFA
- Non Esterified Fatty Acids
- LAB986-VML
- LAB986VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Overnight fasting specimen is preferred.

Collect:
Serum Separator Tube (SST). Collect on ice.

Specimen Preparation:
Allow serum specimen to clot completely on ice. Serum must be separated from cells and frozen immediately, otherwise lipase continues to break down triglycerides, giving rise to elevated levels of nonesterified (free) fatty acids. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Specimens collected in EDTA, heparin, sodium fluoride/potassium oxalate, sodium citrate, or ammonium oxalate. Non-frozen specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 4 hours; Frozen: 1 month

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- FFA
- Free Fatty Acids
- Free Fatty Acids, Serum
- NEFA
- Non Esterified Fatty Acids
- LAB986-VML
- LAB986VML

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Spectrophotometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 17, 2014
0-5 months: less than or equal to 0.73 mmol/L
6 months-1 year: less than or equal to 0.99 mmol/L
2-17 years: less than or equal to 1.78 mmol/L
18 years or older: less than or equal to 0.78 mmol/L

Methodology:
Quantitative Spectrophotometry

Felbamate

LAB686

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), green (sodium heparin), gray (sodium fluoride/potassium oxalate). Avoid use of separator tubes and gels.

Synonyms:

- Felbatol
- LAB686-VML
- LAB686VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), green (sodium heparin), gray (sodium fluoride/potassium oxalate). Avoid use of separator tubes and gels.

Specimen Preparation:
Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 2 weeks

Performed:
Mon-Fri

ORDERING

Synonyms:

- Felbatol
- LAB686-VML
- LAB686VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Mon-Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 15, 2021

Therapeutic Range	30-60 µg/mL
Toxic Level	Greater than or equal to 100 µg/mL

Interpretive Data:
Felbamate is indicated for treatment of epilepsy. The therapeutic range is based on serum, predose (trough) draw collection at steady-state concentration. Patient pharmacokinetics may be variable due to age, co-medications, and/or compromised renal function. Adverse effects may include nausea, vomiting, dizziness, blurred vision and ataxia. Felbamate use may increase the incidence of liver failure and aplastic anemia.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Fentanyl and Metabolite, Urine, Quantitative

LAB393

ORDERING INFO

Collect:
Random urine.

Synonyms:

- fentanyl and norfentanyl urine concentrations
- Actiq
- Duragesic
- Durogesic
- Fentora
- Innovar
- Instanyl
- Ionsys
- Onsolis
- Sublimaze
- LAB393-VML
- LAB393VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 4 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 month; Refrigerated: 1 month; Frozen: 9 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- fentanyl and norfentanyl urine concentrations
- Actiq
- Duragesic
- Durogesic
- Fentora
- Innovar
- Instanyl
- Ionsys
- Onsolis
- Sublimaze
- LAB393-VML
- LAB393VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Fentanyl, Urine Screen with Reflex to Quantitation (2012284).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Compare to Fentanyl, Quantitative, with medMATCH, Urine.

RESULTS INTERPRETATION

Reference Interval:

Drugs Covered	Cutoff Concentrations
Fentanyl	1.0 ng/mL
Norfentanyl	1.0 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry
Positive cutoff: 1.0 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

15° to 25°C: 8 hrs; 2° to 8°C: 3 days; Frozen: 3 months

Specimen:
Cervicovaginal secretions

Alternate Specimen:
N/A

ORDERING

Synonyms:

- FFN , LAB287
- LAB287-VML
- LAB287VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Lateral flow, solid-phase immuno-chromatography

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Presence of fetal fibronectin (ffN) in symptomatic women indicates an increased risk for preterm delivery; absence of ffN in symptomatic women indicates decreased intervention. Utilization of ffN testing in symptomatic women may greatly reduce costs associated with treatment of suspected preterm labor. This test has been recommended by the American College of Obstetricians and Gynecologists (ACOG), who currently supports ffN testing as an adjunctive diagnostic tool in symptomatic patients. ffN testing has a positive predictive value of 40-60% and a negative predictive value of 99.5%.

Methodology:
Lateral flow, solid-phase immuno-chromatography

Turn Around Time:

2 hours, once received into lab

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 8 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB314, FBG, Fibrinogen Level
- LAB314-VML
- LAB314VML

Performed:
Daily

Turn Around Time:
2 hours, once received into lab

Methodology:
Clotting

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
188 - 450 mg/dL

Interpretive Data:
Anti-IIa (thrombin) inhibitors may cause a false decrease in the fibrinogen level. In patients receiving thrombolytic therapy, the plasma level of fibrin degradation products (FDP) may be elevated. At fibrinogen concentrations of <150 mg/dL, FDPs greater than 130 mcg/mL inhibit the thrombin clotting rate of fibrinogen. High levels of paraproteins may interfer with fibrin polymerization.

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Samples from patients receiving thrombolitic thereapy should be collected in a tube containing a mixture of anticolgulant and a plasmin inhibitor to eliminate the possiblity of underestimating the fibrinogen level.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FINE NEEDLE ASPIRATION

ORDERING INFO

Collect:
Clean specimen container with RPMI (provided by laboratory) or saline.

Synonyms:

- FNA, FNA, Cytology, Fine Needle Biopsy

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container with RPMI (provided by laboratory) or saline.

Specimen Preparation:
Palpable FNA or FNA for rapid on-site evaluation: 1. Clinic staff contact the Cytopathology lab at 615-322-2721 to request the procedure. 2. Place Epic order Cytology Non-Gyn/FNA, and have patient labels available when Cytology arrives. 3.Specimen is collected in appropriate container and slides are prepared by laboratory staff. Clinic collect FNA: 1. Collect the specimen in the appropriate specimen container (min 1mL). 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 4. Please send Epic requisition and specimen vial to the lab. Please call the lab at 615-322-2721 if assistance is needed before collecting an FNA specimen. For after-hour procedures please contact the surgical pathology fellow via the hospital operator for collection instructions. (Minimum: Obtain as much as clinical judgement allows)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Fresh specimen in a clean specimen container with or without prepared slides.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Provide body site and laterality, need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc. Additional testing, such as molecular studies, can be requested by the provider, and will be ordered by pathology staff if applicable.

Synonyms:

- FNA, FNA, Cytology, Fine Needle Biopsy

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
Fine needle aspiration procedure

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor. Thyroid interpretations are determined by Bethesda System.

Flecainide

LAB687

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA or K_3EDTA), green (sodium or lithium heparin), or gray (sodium fluoride/potassium oxalate).

Synonyms:

- Almarytm
- Apocard
- Ecrinal
- Flecaine
- Tambocor
- LAB687-VML
- LAB687VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA or K_3EDTA), green (sodium or lithium heparin), or gray (sodium fluoride/potassium oxalate).

Specimen Preparation:
Separate serum or plasma from cells within 6 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Gel separator tubes or gels of any kind; drug loss is immediate and no testing will be performed.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 6 weeks; Refrigerated: 6 weeks; Frozen: 6 weeks

Performed:
Mon, Thu, Sat

ORDERING

Synonyms:

- Almarytm
- Apocard
- Ecrinal
- Flecaine
- Tambocor
- LAB687-VML
- LAB687VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Mon, Thu, Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
Therapeutic Range:
0.20-1.00 µg/mL
Toxic: > 1.50 µg/mL

Interpretive Data:
Toxic concentrations may cause cardiac abnormalities, hypotension and seizure.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Patient Preparation:

N/A

Collect:

Lavender tube (EDTA), ACD-A (yellow top)

Specimen Preparation:

Collect BEFORE 3 pm Monday - Friday and deliver to Specimen Management immediately. Fill tube to indicator line and mix well. (Min >1.0ml Blood)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient: (15-25°C)

Performed:

Monday - Saturday

Stability:

Ambient: (15-25°C): 24 hours

Specimen:

Whole blood

Alternate Specimen:

Lavender tube (EDTA)

ORDERING

Ordering Indicators:

This test identifies and quantifies populations of leukocytes and erythrocytes lacking GPI-anchored proteins. This is central to the diagnosis of PNH, and can be helpful in the evaluation of other disease processes, such as myelodysplastic syndrome and aplastic anemia.

Synonyms:

- LAB928, PNH
- LAB928-VML
- LAB928VML

Performed:
Monday - Saturday

Turn Around Time:
24 hours M-F

Methodology:
Flow Cytometry

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
No loss of GPI-anchored proteins similar to a normal patient pattern, with a validated lower limit of detection of 0.1% of total cells assayed

Interpretive Data:
PNH flow is performed on leukocytes first, and erythrocyte PNH flow is only performed if the leukocyte result is positive. Positive results are given in the form of a narrative report, which indicates the percentage of monocytes, granulocytes, and erythrocytes lacking GPI-anchored proteins.

Methodology:
Flow Cytometry

ADDITIONAL INFORMATION

Section:
Hematopathology/ Flow Cytometry

Alternate Specimen:
Lavender tube (EDTA)

Components:

Flow Fetal Red Blood Cell Enumeration Assay including recommended RhIG dose

LAB3461

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB3461, FCF, Fetal RBC Stain, FRBC Detection Assay, Replaces Kleihauer-Betke Stain
- LAB3461-VML
- LAB3461VML

Turn Around Time:
Samples received in the Flow Cytometry lab by 3 P.M. Mon-Sat will be reported that same day. Lab will call results upon completion if contact information is provided.

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Fill tube to indicator line and mix well. (Min >1.0ml Blood)

Pediatric Collection:
Two Lavender microtainerss (EDTA)

Storage/Transport Temperature:
Ambient (15-25°C) or refrigerated (2-8°C)

Performed:
Monday - Saturday

Stability:
3 days

Specimen:
Whole Blood

Alternate Specimen:
Pink EDTA

ORDERING

Ordering Indicators:
This test identifies and enumerates fetal red cells containing a high percentage of hemoglobin F, for the purpose of determining dosage of anti-Rh antibody in Rh-negative mothers.

Synonyms:

- LAB3461, FCF, Fetal RBC Stain, FRBC Detection Assay, Replaces Kleihauer-Betke Stain
- LAB3461-VML
- LAB3461VML

Performed:
Monday - Saturday

FLT3-ITD Mutation Detection, Whole Blood or Bone Marrow

LAB3031

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB3031, FL3, FLT3-ITD, FLT3 INTERNAL TANDEM DUPLICATION
- LAB3031-VML
- LAB3031VML

Turn Around Time:
10 days

SPECIMEN REQUIREMENTS

Patient Preparation:
Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:
Two Lavender microtainers (EDTA)

Storage/Transport Temperature:
Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:
Monday and Thursday

Stability:
EDTA and AC-A: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70C

Specimen:
Whole blood or bone marrow

Alternate Specimen:
Yellow tube (ACD-A)

ORDERING

Ordering Indicators:
The analysis of FLT3-ITD mutations aids in the diagnosis and management of acute myeloid leukemia (AML).

Synonyms:

- LAB3031, FL3, FLT3-ITD, FLT3 INTERNAL TANDEM DUPLICATION
- LAB3031-VML
- LAB3031VML

Performed:
Monday and Thursday

Turn Around Time:
10 days

Methodology:
Fluorescent PCR designed to detect FLT3-ITD mutations with fragment size analysis by capillary electrophoresis; Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
Results must be interpreted in the appropriate clinical context. Refer to report.

Fluconazole, Quantitative by LC-MS/MS

LAB3741

ORDERING INFO

Collect:
Plain Red, Lavender (EDTA), or Green (Sodium or Lithium Heparin).

Synonyms:

- Diflucan
- LAB3741-VML
- LAB3741VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain Red, Lavender (EDTA), or Green (Sodium or Lithium Heparin).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.6 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, Light Blue (citrate), or Yellow (SPS or ACD solution).

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 48 hours; Frozen: 6 months

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- Diflucan
- LAB3741-VML
- LAB3741VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Tue, Thu, Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 15, 2011

Therapeutic Range: 5.0-20.0 µg/mL

Interpretive Data:
Fluconazole is a synthetic triazole antifungal drug indicated to treat candidiasis and cryptococcal meningitis infections. The therapeutic range is based on serum, predose (trough) draw collection at steady-state concentration. The pharmacokinetics of fluconazole are influenced by drug-drug interactions when coadministered with drugs metabolized by cytochrome P450 2C9, 2C19 and 3A4 enzymes. Adverse effects may include headache, skin rash, abdominal pain and hepatitis.

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Follicle Stimulating Hormone (polyclonal) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath111

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- FSH

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Ordering Indicators:
N/A

Synonyms:

- FSH

Performed:
Monday-Friday

Turn Around Time:
2 Days

Methodology:
Immunohistochemical Stain

Components:
Stained slide and control

RESULTS INTERPRETATION

Reference Interval:
N/A

Interpretive Data:
N/A

Methodology:
Immunohistochemical Stain

ADDITIONAL INFORMATION

Section:
Histology

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Additional Information:
Complete VPLS Test Requisition. Request special requisition form No 60-002-664 if ordering on a regular basis. Package slides in durable slide holder and place with any block in padded envelope to protect from breaking.

Components:
Stained slide and control

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

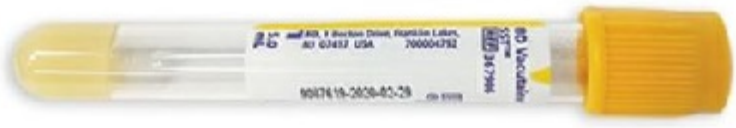
Follicle Stimulating Hormone, Serum

LAB86

ORDERING INFO

Collect:
Gold (Clot Activator with Gel)



Synonyms:

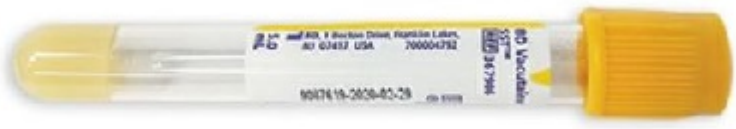
- Follicle Stimulating Hormone, FSH, FSH Level, LAB86
- LAB86-VML
- LAB86VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Samples should not be taken from patients taking biotin until at least 8 hours following the last dose.

Collect:
Gold (Clot Activator with Gel)



Specimen Preparation:
Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.3 mL)

Pediatric Collection:
1 Gold Microtainer (Clot Activator with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 5 days; 2° to 8°C: 14 days; Frozen: 6 months

Specimen:
Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Fondaparinux Level

LAB3446

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB3446, FON, Arixtra Assay, Anti-Xa Assay, Fondaparinux Level
- LAB3446-VML
- LAB3446VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB3446, FON, Arixtra Assay, Anti-Xa Assay, Fondaparinux Level
- LAB3446-VML
- LAB3446VML

Performed:
Daily

Turn Around Time:
1 - 3 days

Methodology:
Chromogenic

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Therapeutic range: Typical range for a 7.5mg dose: 0.50 - 1.50 ug/ml

Interpretive Data:
Oral anti-Xa inhibitors interfer with anti-Xa assays for Fondaparinux. Even at subtheraputic levels, anti-Xa inhibitors may result in an overestimation of the Fondaparinux level. The result is dependent on the concentration of antithrombin in the test plasma. Antithrombin deficiency may result in an undersestimation of the Fondaparinux level. Plasma hemoglobin levels of >150 mg/dL may result in an overestimation of the Fondaparnux level.

Methodology:
Chromogenic

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Performed daily from 7:00 AM to 4:00 PM. Sample must be received in the laboratory by 2:00 PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call (refer to Synergy for contact information).

Components:
N/A

Fragile X (FMR1) Analysis, Whole Blood

LAB3032

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3032, FXM, FRAGILE X GENE (FMR1), Fragile X Mutation
- LAB3032-VML
- LAB3032VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission. Please notify Molecular Genetics Laboratory if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood)

Pediatric Collection:

Two Lavender microtainers (EDTA)

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Wednesday

Stability:

EDTA and Sodium Heparin: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70C

Specimen:

Whole Blood

Alternate Specimen:

Dark green tube (Sodium Heparin)

ORDERING

Ordering Indicators:

This assay is intended to confirm a diagnosis of fragile X syndrome, fragile X tremor/ataxia syndrome (FXTAS), or fragile X-associated primary ovarian insufficiency (FXPOI). Patients most often referred for this testing include 1) children with intellectual disability, 2) patients with autism spectrum disorder, 3) adult females with primary ovarian insufficiency, 4) adult males with tremor/ataxia, 5) family members of patients with FX syndrome who are at risk" for premutation alleles, and 6) females with a family history of intellectual disability suggestive of FX syndrome.

Synonyms:

- LAB3032, FXM, FRAGILE X GENE (FMR1), Fragile X Mutation
- LAB3032-VML
- LAB3032VML

Performed:
Wednesday

Turn Around Time:
10 days

Methodology:
Direct detection of CGG expansion alleles of the FMR1 gene by fluorescent PCR with fragment size analysis by capillary electrophoresis (Asuragen AmplideX assay).

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Normal: 5-44 CGG repeats. Intermediate or "grey zone": 45-54 CGG repeats. Premutation: 55-200 CGG repeats. Full mutation: >200 CGG repeats.

Interpretive Data:
Results must be interpreted in the appropriate clinical context. Refer to report.

Free Light Chains, serum

LAB735

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB735, FLC, Free Light Chain Quantification
- LAB735-VML
- LAB735VML

Turn Around Time:
3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Red tube (no gel)

Specimen Preparation:
Centrifuge immediately and refrigerate. (Minimum 0.5 mL serum)

Pediatric Collection:
Two red microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
After separation from cells: Refrigerated (2-8°C): 21 days

Specimen:
Serum

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test aids in the diagnosis and monitoring of multiple myeloma, lymphocytic neoplasms, Waldenstr&oumlm's macroglobulinemia, AL amyloidosis, light chain deposition disease, and connective tissue diseases such as systemic lupus erythematosus (SLE) in conjunction with other laboratory and clinical findings.

Synonyms:

- LAB735, FLC, Free Light Chain Quantification
- LAB735-VML
- LAB735VML

Performed:
Monday - Friday

Turn Around Time:
3 days

Methodology:
Turbidimetric

Components:
KLC, LLC, Kappa/Lambda Ratio

RESULTS INTERPRETATION

Reference Interval:
0.26 - 1.65

Interpretive Data:
Elevated levels of monoclonal FLC are associated with malignant plasma cell proliferation (e.g. multiple myeloma), AL amyloidosis, and light chain deposition disease. Raised serum levels of polyclonal FLC may be associated with autoimmune diseases such as SLE.

Methodology:
Turbidimetric

Fructosamine

LAB5885

ORDERING INFO

Collect:
Serum separator tube. Also acceptable: Pink (K_2EDTA), or green (lithium heparin).

Synonyms:

- Glycated Albumin
- Glycated Protein
- Glycated Serum Protein
- GSP
- Protein Bound Glucose
- LAB5885-VML
- LAB5885VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Also acceptable: Pink (K_2EDTA), or green (lithium heparin).

Specimen Preparation:
Allow specimen to clot completely at room temperature before centrifuging. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Hemolyzed specimens (may cause falsely elevated results).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Glycated Albumin
- Glycated Protein
- Glycated Serum Protein
- GSP
- Protein Bound Glucose
- LAB5885-VML
- LAB5885VML

Ordering Recommendations:
May aid in monitoring glucose control for diabetes in specific disorders. Not recommended as a substitute for hemoglobin A1c except in specific populations.

Performed:
Sun-Sat

Methodology:
Quantitative Spectrophotometry

Reported:
Within 24 hours

Notes:
High levels of ascorbic acid interfere with the fructosamine assay. Patients should abstain from ascorbic acid supplements for a minimum of 24 hours prior to sample collection.

RESULTS INTERPRETATION

Reference Interval:
Effective February 22, 2022
Nondiabetic: 205-285 µmol/L

Interpretive Data:
Variations in levels of serum proteins (albumin and immunoglobulins) may affect fructosamine results.

Methodology:
Quantitative Spectrophotometry

ADDITIONAL INFORMATION

CPT Codes:
82985

Section:
RF-ARUP

Notes:
High levels of ascorbic acid interfere with the fructosamine assay. Patients should abstain from ascorbic acid supplements for a minimum of 24 hours prior to sample collection.

Resulting Laboratory:
ARUP Laboratories

Collect:
Serum separator tube. Also acceptable: Pink (K_2EDTA), or green (lithium heparin).

Specimen Preparation:
Allow specimen to clot completely at room temperature before centrifuging. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Hemolyzed specimens (may cause falsely elevated results).

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 2 months

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- Glycated Albumin
- Glycated Protein
- Glycated Serum Protein
- GSP
- Protein Bound Glucose
- LAB5885-VML
- LAB5885VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
Within 24 hours

Ordering Recommendations:
May aid in monitoring glucose control for diabetes in specific disorders. Not recommended as a substitute for hemoglobin A1c except in specific populations.

Interpretive Data:
Variations in levels of serum proteins (albumin and immunoglobulins) may affect fructosamine results.

Reference Interval:
Effective February 22, 2022
Nondiabetic: 205-285 µmol/L

Methodology:
Quantitative Spectrophotometry

Section:
RF-ARUP

CPT Codes:
82985

Notes:
High levels of ascorbic acid interfere with the fructosamine assay. Patients should abstain from ascorbic acid supplements for a minimum of 24 hours prior to sample collection.

Fumarate Hydratase (H-6) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath112

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- FH

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Fungal Antibodies with Reflex to *Blastomyces dermatitidis* Antibodies by Immunodiffusion, CSF

LAB5996

ORDERING INFO

Collect:
CSF.

Synonyms:

- Aspergillus
- Blastomyces
- Coccidiodes
- fungal meningitis
- Histoplasma
- LAB5996-VML
- LAB5996VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 2 mL CSF to an ARUP standard transport tube. (Min: 1 mL)

Unacceptable Conditions:
Other body fluids. Contaminated, hemolyzed, xanthochromic, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Aspergillus
- Blastomyces
- Coccidiodes
- fungal meningitis
- Histoplasma
- LAB5996-VML
- LAB5996VML

Ordering Recommendations:
Not recommended for the diagnosis of fungal infection of the central nervous system. Includes testing by complement fixation for Aspergillus, Coccidioides, and Histoplasma and testing by immunoassay for Blastomyces. Refer to individual fungus-specific testing according to patient exposure.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Complement Fixation/Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)/Qualitative Immunodiffusion

Reported:
2-6 days

Notes:
This test detects antibodies to Aspergillus, Coccidioides, and Histoplasma by complement fixation and Blastomyces by immunoassay.
If Blastomyces antibodies are equivocal or positive by immunoassay then Blastomyces dermatitidis Antibodies by Immunodiffusion, CSF will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Coccidioides Ab by CF, CSF	Less than 1:2
Aspergillus Antibody, CSF (CF)	Less than 1:2
Histoplasma M, CSF (CF)	Less than 1:2
Histoplasma Y, CSF (CF)	Less than 1:2
Blastomyces Antibodies EIA, CSF	0.9 IV or less

Interpretive Data:
Refer to report.

Methodology:
Semi-Quantitative Complement Fixation/Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)/Qualitative Immunodiffusion

Fungal Culture, Blood

LAB242

ORDERING INFO

Collect:

Myco/F Lytic bottle

Synonyms:

- Blood culture fungus, fungal culture, Histoplasma culture, Blastomyces culture, BCF
- LAB242-VML
- LAB242VML

Turn Around Time:

4 weeks for negative. Positive growth reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Myco/F Lytic bottle

Specimen Preparation:

Skin antisepsis is imperative to avoid contamination. Disinfect the venipuncture site with 2% chlorhexidine or 2% iodine tincture. Chlorhexidine is not recommended for children < 2 months old. Swab with disinfectant for 1 min, and allow to dry, prior to venipuncture. Do not collect from vein which intravenous solution is being delivered. Drawing blood from a port of an indwelling catheter should ONLY be done if poor access requires this practice.Send to laboratory immediately following collection. (Min: 1 mL blood)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient: (15-25°C)

Performed:

Daily

Stability:

Ambient: (15-25°C), deliver to laboratory as soon as possible.

Specimen:

Blood

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Use to culture pathogenic fungi from blood. Candida spp are detectable by Bacterial Culture, Blood test (LAB 462, adults and LAB 3089, pediatrics).

Synonyms:

- Blood culture fungus, fungal culture, Histoplasma culture, Blastomyces culture, BCF
- LAB242-VML

Gabapentin

LAB470

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or Pink (K_2EDTA).

Synonyms:

- Gabapentin, Free
- Gabarone
- Neurontin
- LAB470-VML
- LAB470VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or Pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 month; Refrigerated: 1 month; Frozen: 2 months

Performed:
Mon, Wed, Thu, Fri, Sat

ORDERING

Synonyms:

- Gabapentin, Free
- Gabarone
- Neurontin
- LAB470-VML
- LAB470VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Mon, Wed, Thu, Fri, Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 18, 2013

Therapeutic Range	2-20 µg/mL
Toxic	Not well established

Interpretive Data:
Pharmacokinetics of gabapentin vary widely among patients, particularly those with compromised renal function. Adverse effects may include somnolence, dizziness, ataxia, and fatigue.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Galactose-1-Phosphate in Red Blood Cells

LAB6436

ORDERING INFO

Collect:
Lavender (EDTA) or green (sodium or lithium heparin).

Synonyms:

- Gal1P
- Galactosemia Metabolite(s)
- GALT Analyte
- RBC GAL1P
- Galactose 1 Phosphate
- Galactosemia Analyte
- Galactose 1
- LAB6436-VML
- LAB6436VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or green (sodium or lithium heparin).

Specimen Preparation:
DO NOT FREEZE. Place tube on wet ice immediately after collection. Transport 5 mL whole blood. (Min: 2 mL)

Unacceptable Conditions:
Frozen or room temperature specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 72 hours; Frozen: Unacceptable

Performed:
Tue, Thu

ORDERING

Synonyms:

- Gal1P
- Galactosemia Metabolite(s)
- GALT Analyte
- RBC GAL1P
- Galactose 1 Phosphate
- Galactosemia Analyte
- Galactose 1
- LAB6436-VML
- LAB6436VML

Ordering Recommendations:
Use to monitor treatment, response, and compliance with dietary restriction for patients with an established diagnosis of galactosemia. To diagnose or rule out galactosemia, refer to Galactosemia (GALT) Enzyme Activity and 9 Mutations (0051175).

Performed:
Tue, Thu

Methodology:
Gas Chromatography-Mass Spectrometry (GC-MS)

Reported:
2-9 days

Notes:

Alternate acceptable specimen is frozen, washed red blood cells.
1. Centrifuge whole blood immediately for 10 minutes at 800 g RCF.
2. Discard the plasma and buffy coat layers.
3. Add cold 0.9 percent saline solution to the red cells (about 2 times the volume of cells) and mix gently by inverting the tube.
4. Centrifuge for 10 minutes at 800 g RCF.
5. Aspirate and discard the supernatant.
6. Repeat the wash (steps 3 through 5) 2 more times.
7. After the 3rd wash and centrifugation, remove the supernatant and a thin layer of the top cells.
8. Transfer washed cells to an ARUP standard transport tube and freeze. Ship on dry ice and include an ORDER COMMENT stating the specimen is washed, packed red blood cells.

Washed red cells must be frozen. Ambient and refrigerated washed cells are unacceptable

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Galactose-1-phosphate (mg/dL)	0.0-1.0 mg/dL
Galactose-1-phosphate (ug/g Hb)	0-53 ug/g Hb
Galactose-1-phosphate (umol/g Hb)	0.00-0.20 umol/g Hb

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Gamma Glutamyl Transferase, Plasma or Serum

LAB85

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- GGT, Gamma-Glutamyl Transferase (Ggt) Blood, GGT Blood, LAB85
- LAB85-VML
- LAB85VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.3 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 7 days; 2° to 8°C: 7 days; Frozen: 1 year

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

Ganglioside (GM1) Antibodies, IgG and IgM

LAB3748

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Anti-GM Antibodies
- Anti-GM1 Antibody Panel
- Ganglioside (GM1) Antibodies, IgG and IgM
- GM1 IgG IgM
- Ganglioside Antibodies
- Ganglioside Abs IgG and IgM
- Ganglioside-Monosialic Acid Ab
- LAB3748-VML
- LAB3748VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.3 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL)

Unacceptable Conditions:
Room temperature specimens. Plasma, CSF, or other body fluids. Contaminated, heat-inactivated, hemolyzed, icteric, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year.

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Anti-GM Antibodies
- Anti-GM1 Antibody Panel
- Ganglioside (GM1) Antibodies, IgG and IgM
- GM1 IgG IgM
- Ganglioside Antibodies
- Ganglioside Abs IgG and IgM
- Ganglioside-Monosialic Acid Ab
- LAB3748-VML
- LAB3748VML

Ordering Recommendations:
May be useful when assessing for primarily motor neuron disease and motor neuropathies. Test by itself is not diagnostic and should be used in conjunction with other clinical parameters to confirm disease.

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
GM1 Antibody, IgG	50 IV or less
GM1 Antibody, IgM	50 IV or less

Interpretive Data:

Ganglioside antibodies are associated with diverse peripheral neuropathies. Elevated antibody levels to ganglioside-monosialic acid (GM1) are associated with motor or sensorimotor neuropathies, particularly multifocal motor neuropathy. Anti-GM1 may occur as IgM (polyclonal or monoclonal) or IgG antibodies. These antibodies may also be found in patients with diverse connective tissue diseases as well as normal individuals. These tests by themselves are not diagnostic and should be used in conjunction with other clinical parameters to confirm disease.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
GM1 Antibody IgG	29 IV or less: Negative 30-50 IV: Equivocal 51-100 IV: Positive 101 IV or greater: Strong Positive
GM1 Antibody, IgM	29 IV or less: Negative 30-50 IV: Equivocal 51-100 IV: Positive 101 IV or greater: Strong Positive

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Performed:
Mon, Wed-Sat

ORDERING

Synonyms:

- Anti-GPA (AGPA)
- Anti-Parietal Cell Antibody (APCA)
- Parietal Cell Ab, IgG
- PCA
- PCA IgG
- Hydrogen Potassium (H+/K+) ATPase
- LAB3809-VML
- LAB3809VML

Ordering Recommendations:
Use to evaluate pernicious anemia or immune-mediated deficiency of vitamin B12 with or without megaloblastic anemia. Negative results do not rule out pernicious anemia.

Performed:
Mon, Wed-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-3 days

Notes:
Most patients with pernicious anemia have parietal cell antibodies. However, the fact that such antibodies are found with increased frequency in unaffected family members, as well as in patients with other autoimmune diseases, suggests these antibodies do not cause disease by themselves.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Gastric Parietal Cell Antibody, IgG	24.9 Units or less

Interpretive Data:

In the context of vitamin B12 deficiency, the presence of gastric parietal cell antibodies (PCA) and/or intrinsic factor antibodies in association with macrocytic anemia is considered diagnostic for pernicious anemia (PA). However, the presence of gastric PCAs alone is not specific for PA. Gastric PCAs may occur with increased frequency in unaffected family members, a small percentage of healthy individuals, and patients with other autoimmune diseases, such as autoimmune thyroiditis.

Component	Interpretation
Parietal Cell Antibody, IgG	0.0-20.0 Units Negative 20.1-24.9 Units Equivocal 25.0 Units or greater Positive

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay

ADDITIONAL INFORMATION

CPT Codes:

83516

Section:

RF-ARUP

Notes:

Most patients with pernicious anemia have parietal cell antibodies. However, the fact that such antibodies are found with increased frequency in unaffected family members, as well as in patients with other autoimmune diseases, suggests these antibodies do not cause disease by themselves.

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL)

Unacceptable Conditions:

Urine or plasma. Contaminated, heat-inactivated, grossly hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:

Refrigerated.

Gastric urease

LAB3098

ORDERING INFO

Collect:
Gastric mucosal biopsy; place on CLOtest media as soon as collected.

Synonyms:

- Gastric urease, CLOtest, H. pylori, Helicobacter pylori
- LAB3098-VML
- LAB3098VML

Turn Around Time:
1 day

SPECIMEN REQUIREMENTS

Patient Preparation:
Patients should not have taken antibotics or bismuth salts for at least 3 weeks prior to endoscopy. Suppression of H. pylori by these may lead to false-negative results.

Collect:
Gastric mucosal biopsy; place on CLOtest media as soon as collected.

Specimen Preparation:
Before use, the CLOtest should be examined to ensure well is full and yellow. Warm slide to room temperature before collecting biopsy. Collect biospy in area of erosion or ulceration. Make certain the biopsy sample is buried in the gel. (Min: 1 biopsy).

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Ambient: (15-25°C) 72 hours

Specimen:
Gastic mucosal biopsy

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Assessment of H. pylori infection.

Synonyms:

- Gastric urease, CLOtest, H. pylori, Helicobacter pylori

Gastrointestinal Pathogen Panel by PCR

LAB5886

ORDERING INFO

Collect:
Stool (Para-Pak® Single-Vial C and S [orange cap])

Synonyms:

- LAB5886, GIP, Gastrointestinal Pathogen Panel, Stool Panel, Gastroenteritis panel
- LAB5886-VML
- LAB5886VML

Turn Around Time:
24 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Stool (Para-Pak® Single-Vial C and S [orange cap])

Specimen Preparation:
Please follow collection instructions on the Stool Specimen Container Para-Pak® Single-Vial C and S insert. Open the tube containing the pink liquid (Do not discard liquid). Using the collection spoon built into the lid of the tube, place small scoopfuls of stool from areas which appear bloody, slimy, or watery into the tube until the contents rise to the red fill line. If the stool is formed (hard), please try to sample small amounts from each end and in the middle. (Min 0.5mL Liquid Stool)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient (15-25°C)

Performed:
Daily

Stability:
Stool: Ambient (15-25°C): up to 24 hours; Refrigerated (2-8°C): up to 3 days. Para-Pak: Ambient (15-25°C): up to 48 hours; Refrigerated (2-8°C): up to 7 days.

Specimen:
Stool

Alternate Specimen:
Raw stool can be accepted, but will need to be sent to lab within 24 hours. Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
The Gastrointestinal Pathogen Panel is performed on stool specimens within the VUMC Molecular Infectious Diseases Laboratory. The following targets are included on the Gastrointestinal Pathogen Panel: Campylobacter, Salmonella, Vibrio, Vibrio cholerae, Yersenia entercolitica, Enterotoxigenic E. coli (ETEC) lt/st, Shiga-like toxin-producing E. coli (STEC) stx1/stx2, E. coli O157, Shigella/Enteroinvasive E. coli (EIEC), Cryptosporidium, Cyclospora cayetanensis, Entamoeba histolytica, Giardia lamblia, Adenovirus F 40/41, Astrovirus, Norovirus GI/GII, Rotavirus A, Sapovirus

Synonyms:

- LAB5886, GIP, Gastrointestinal Pathogen Panel, Stool Panel, Gastroenteritis panel

LAB27

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- GRN, GML, Garamycin, LAB27
- LAB27-VML
- LAB27VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Dark Green Microtainer (Sodium Heparin)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 2° to 8°C: 7 days; Frozen: 14 days

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

Glomerular Basement Membrane Antibody, IgG by Multiplex Bead Assay

LAB3749

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Basement Membrane Antibody
- Glomerular Anti-Basement Membrane
- GBM Antibody
- Anti-GBM Antibody-IgG
- Anti-Glomerular Basement Membrane Antibody
- Antiglomerular Basement Membrane Antibody-IgG
- Basement Membrane, Glomerular Antibody
- Anti-GBM Antibody
- LAB3749-VML
- LAB3749VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Basement Membrane Antibody
- Glomerular Anti-Basement Membrane
- GBM Antibody
- Anti-GBM Antibody-IgG
- Anti-Glomerular Basement Membrane Antibody
- Antiglomerular Basement Membrane Antibody-IgG
- Basement Membrane, Glomerular Antibody
- Anti-GBM Antibody
- LAB3749-VML
- LAB3749VML

Ordering Recommendations:
May be useful in detecting glomerular basement membrane (GBM) antibodies. Combined use of IFA Glomerular Basement Membrane Antibody, IgG by Multiplex Bead Assay and IFA (2008403) may improve diagnostic sensitivity for disease. If positive, may be useful for monitoring treatment response.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Multiplex Bead Assay

Reported:
1-2 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
GBM Ab, IgG by Multiplex Bead Assay	0-19 AU/mL

Interpretive Data:

The presence of anti-glomerular basement membrane (GBM) antibodies by Multiplex Bead Assay, may aid in the diagnosis of Goodpasture syndrome. False positive results may occur due to reactivity against other chains of type IV collagen. If Multiplex Bead Assay is negative but there is strong suspicion for disease, renal biopsy may be indicated. A renal biopsy may also be essential in suspected Goodpasture disease with renal involvement, allowing diagnostic confirmation and assessment of renal prognosis.

Component	Interpretation
Glomerular Basement Membrane Antibody, IgG by Multiplex Bead Assay	19 AU/mL or less Negative 20-25 AU/mL Equivocal 26 AU/mL or greater Positive

Methodology:

Semi-Quantitative Multiplex Bead Assay

Glucose Transporter-1 (polyclonal) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath116

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- GLUT-1

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Glucose-6-Phosphate Dehydrogenase

LAB571

ORDERING INFO

Collect:
Yellow (ACD solution A). Also acceptable: Green (sodium or lithium heparin), lavender (K2EDTA or K3EDTA), or pink (K2EDTA). Enzyme most stable in acid citrate dextrose (ACD).

Synonyms:

- G-6-PD
- G6PD Erythrocytes
- RBC G6PD test
- LAB571-VML
- LAB571VML

SPECIMEN REQUIREMENTS

Collect:
Yellow (ACD solution A). Also acceptable: Green (sodium or lithium heparin), lavender (K2EDTA or K3EDTA), or pink (K2EDTA). Enzyme most stable in acid citrate dextrose (ACD).

Specimen Preparation:
Do not freeze. Transport 3 mL whole blood. (Min: 1.5 mL heparin or EDTA collection tube; Min: 0.5 mL pediatric collection tube).

Unacceptable Conditions:
Clotted, frozen, or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 1 week; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Pediatric minimum 0.5 mL if collected and transported in a pediatric collection K2EDTA tube. ACD collection tubes should be filled to maximum collectible volume and are not recommended for pediatric specimen collection or preservation.

ORDERING

Synonyms:

- G-6-PD
- G6PD Erythrocytes
- RBC G6PD test
- LAB571-VML
- LAB571VML

Ordering Recommendations:
Preferred initial screening test for G6PD deficiency. For genetic testing in individuals of African descent, refer to Glucose-6-Phosphate Dehydrogenase (G6PD) 2 Mutations (0051684); for genetic testing in individuals with other high-risk ethnic backgrounds, refer to Glucose-6-Phosphate Dehydrogenase Deficiency (G6PD) Sequencing (3004457).

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay

Reported:
1-3 days

Notes:
Patients who have recently received transfusions have normal donor cells that may mask G-6-PD deficient erythrocytes.

RESULTS INTERPRETATION

Reference Interval:
Effective November 17, 2014
9.9-16.6 U/g Hb

Methodology:
Quantitative Enzymatic Assay

ADDITIONAL INFORMATION

CPT Codes:
82955

Section:
RF-ARUP

Remarks:
Pediatric minimum 0.5 mL if collected and transported in a pediatric collection K2EDTA tube. ACD collection tubes should be filled to maximum collectible volume and are not recommended for pediatric specimen collection or preservation.

Notes:
Patients who have recently received transfusions have normal donor cells that may mask G-6-PD deficient erythrocytes.

Resulting Laboratory:
ARUP Laboratories

Glutamic Acid Decarboxylase Antibody

LAB650

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- 64K Antibody
- Anti-GAD Antibodies
- Anti-Glutamic Acid Decarboxylase Ab
- Beta Cell Antibody
- Beta-Cell Autoantibody to GAD 65
- GAD Antibody
- GAD-65
- GAD65
- GAD65 Antibody Assay
- Pancreatic Islet Cell Ab
- Glutamate Decarboxylase Antibodies
- LAB650-VML
- LAB650VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Grossly hemolyzed specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 1 week; Frozen: 3 months

Performed:
Sun-Fri

ORDERING

Synonyms:

- 64K Antibody
- Anti-GAD Antibodies
- Anti-Glutamic Acid Decarboxylase Ab
- Beta Cell Antibody
- Beta-Cell Autoantibody to GAD 65
- GAD Antibody
- GAD-65
- GAD65
- GAD65 Antibody Assay
- Pancreatic Islet Cell Ab
- Glutamate Decarboxylase Antibodies
- LAB650-VML
- LAB650VML

Ordering Recommendations:
Most useful to establish autoimmune etiology in previously diagnosed type 1 diabetes mellitus (DM). Do not use to differentiate type 1 DM from type 2 DM, for most cases.If pursuing antibody testing to determine autoimmune DM, perform at least two antibody tests. In most cases, use glutamic acid decarboxylase antibody in combination with another antibody test. Other antibody tests include Islet Antigen-2 (IA-2) Autoantibody (3001499), Insulin Antibody (0099228), Islet Cell Cytoplasmic Antibody, IgG (0050138), and Zinc Transporter 8 Antibody (2006196). For analysis in CSF, refer to Glutamic Acid Decarboxylase Antibody, CSF (3002788).

Performed:
Sun-Fri

Methodology:
Semi-quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
0.0-5.0 IU/mL

Interpretive Data:
A value greater than 5.0 IU/mL is considered positive for glutamic acid decarboxylase antibody (GAD Ab).

This assay is intended for the semi-quantitative determination of the GAD Ab in human serum. Results should be interpreted within the context of clinical symptoms.

Methodology:
Semi-quantitative Enzyme-Linked Immunosorbent Assay

Group A Streptococcus Culture, Throat

LAB228

ORDERING INFO

Collect:
Collect with flocked swab and place in Eswab (liquid Amies) transport media.

Synonyms:

- Throat culture, pharyngitis, Streptococcus pyogenes culture, Group A Strep Culture, THB
- LAB228-VML
- LAB228VML

Turn Around Time:
1 day

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Collect with flocked swab and place in Eswab (liquid Amies) transport media.

Specimen Preparation:
Extend one flocked swab between the tonsillar pillars and behind uvula, avoiding tongue, buccal mucosa and uvula. Sweep swab back and forth across posterior pharynx, tonsillar areas and any inflamed or exudative areas. Do not obtain specimen if epiglottis is inflammed, as sampling may trigger life-threatening respiratory obstruction. (Min: 1 swab)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) (Refrigerated: (2-8°C)

Performed:
Daily

Stability:
Ambient: (15-25°C) 48 hours (Refrigerated: (2-8°C) 48 hours

Specimen:
Throat swab

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Preferred test for evaluation of pharyngitis caused by Group A Streptococcus. Does not evaluate for other pathogens. For patients with Cystic Fibrosis, order Respiratory Culture, CF (LAB 3091)

Synonyms:

- Throat culture, pharyngitis, Streptococcus pyogenes culture, Group A Strep Culture, THB
- LAB228-VML
- LAB228VML

Performed:
Daily

Turn Around Time:
1 day

Methodology:
Aerobic culture

Components:
Culture

RESULTS INTERPRETATION

Reference Interval:
Negative for Group A Streptococcus

Interpretive Data:
A positive culture result indicates infection with the identified organism. Antimicrobial susceptibility testing is not routinely performed as Group A Streptococcus remain universally susceptible to penicillin.

Methodology:
Aerobic culture

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
N/A

Additional Information:
Identification tests are billed separetly from culture. Susceptibility testing not routinely performed. Call laboratory in case of penicillin allergy, for testing.

Components:
Culture

Resulting Laboratory:
Vanderbilt Medical Laboratories

Collect with flocked swab and place in Eswab (liquid Amies) transport media.

Specimen Preparation:
A single swab is used to obtain specimen first from the lower vagina (near the introitus) and then from the rectum (through the anal sphincter) without use of speculum (Min, 1 swab)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Monday - Friday

Stability:
Ambient: (15-25°C) 48 hours

Specimen:
Vaginal AND rectal swab

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Antepartum screening for Group B Streptococcus

Synonyms:

- GBS, Antenatal screening, Streptococcus agalactiae
- LAB6355-VML
- LAB6355VML

Performed:
Monday - Friday

Turn Around Time:
2-3 days

Methodology:
Real Time PCR

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
Real-time PCR cannot assess antimicrobial resistance. If patient has anaphylactic reaction to pencillin, submit culture if PCR positive to assess for clindamycin resistance.

Methodology:
Real Time PCR

Growth Hormone, serum

LAB525

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

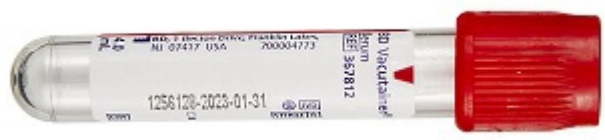
- LAB525, GH
- LAB525-VML
- LAB525VML

Turn Around Time:
3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
For unstimulated measurements, the patient should be fasting and at complete rest for 30 minutes prior to collection. For stimulation or supporession tests, be sure to identify the timed samples carefully.

Collect:
Red tube (no gel)



Specimen Preparation:
Allow specimen to clot completely at room temperature. Specimens should be centrifuged in room temperature centrifuge immediately after clotting and the separated serum frozen. (Minimum: 0.5 mL serum)

Pediatric Collection:
Red microtainer (no gel)

Storage/Transport Temperature:
Frozen (-20°C)

Performed:
Monday - Friday

Stability:
After separation from cells: Refrigerated (2-8°C): 8 hours Frozen (-20°C): 2 months

Specimen:
Serum

Alternate Specimen:
Light green tube (Lithium heparin with gel)

ORDERING

Ordering Indicators:
This test is used to aid in the clinical diagnosis of growth disorders.

Synonyms:

Haloperidol

LAB191

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2EDTA).

Synonyms:

- Haldol
- LAB191-VML
- LAB191VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 4 hours; Refrigerated: 1 week; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Haldol
- LAB191-VML
- LAB191VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:
Effective February 16, 2021

Therapeutic Range:	5.0-20.0 ng/mL
Toxic:	Greater than 50 ng/mL

Interpretive Data:
The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Adverse effects may include drowsiness, blurred vision, tardive dyskinesia, tachycardia, hypotension and muscular rigidity.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

HDL Cholesterol, Plasma or Serum

LAB101

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- HDL, High Density Lipoprotein Cholesterol, LAB101
- LAB101-VML
- LAB101VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting is preferred but not required unless directed by the ordering provider.

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 2 days; 2° to 8°C: 7 days; Frozen: 3 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:
Testing is indicated for cardiovasular risk assessment, cholesterol lowering medication monitoring, familial hyperlipidemia screening, and routine checkups.

Synonyms:

- HDL, High Density Lipoprotein Cholesterol, LAB101
- LAB101-VML
- LAB101VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Acclerator Selective Detergent

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Consensus NCEP Risk Factor - 0-150 yrs: <40 mg/dL (male); <50 mg/dL (female)

Interpretive Data:
An HDL cholesterol less than 40 mg/dL is low and constitutes a coronary heart disease risk factor. An HDL cholesterol greater than 60 mg/dL is a negative risk factor for coronary heart disease. CHD Risk Factors +1 Age: Men > 45 Women > 55 or premature menopause without estrogen therapy +1 Family history of premature CHD +1 Current smoking +1 Hypertension +1 Diabetes mellitus +1 Low HDL cholesterol: < 40 mg/dL -1 High HDL cholesterol: >= 60 mg/dL

Heavy Metals Panel 3, Blood

LAB1019

ORDERING INFO

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Synonyms:

- Arsenic
- arsenic blood level
- AS
- Hg
- Lead
- lead blood level
- Mercury
- mercury blood level
- Pb
- LAB1019-VML
- LAB1019VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, non-essential over-the-counter medications (upon the advice of their physician), and avoid shellfish and seafood for 48 to 72 hours.

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Specimen Preparation:
Transport 6 mL whole blood in the original collection tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens collected in tubes other than Royal blue (K2EDTA) or Royal blue (NaHep). Specimens transported in containers other than Royal blue (K2EDTA) or Royal blue (NaHep) or Trace Element-Free Transport Tube. Clotted specimens.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 week; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Trace Elements requisition form may be required (ARUP form #32990).

ORDERING

Synonyms:

- Arsenic
- arsenic blood level
- AS
- Hg
- Lead
- lead blood level
- Mercury
- mercury blood level
- Pb
- LAB1019-VML
- LAB1019VML

Ordering Recommendations:
Useful in the assessment of recent exposure to arsenic, mercury, and lead. For chronic exposure or the determination of arsenic species, refer to Heavy Metals Panel 4, Urine with Reflex to Arsenic Fractionation (0020572). For occupational exposure, consider Lead, Industrial Exposure Panel, Adults (0025016) and/or Cadmium Exposure Panel - OSHA (0025013).

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-4 days

Notes:
Mercury is volatile; concentration may decrease over time. If the specimen is drawn and stored in the appropriate container, the arsenic and lead values do not change with time.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval	
Lead, Blood (Venous)	**Age**	**Reference Interval (µg/dL)**
	0-5 years	Less than or equal to 3.4

Heavy Metals Panel 3, Urine with Reflex to Arsenic Fractionated

LAB3234

ORDERING INFO

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container and should be refrigerated during collection. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately if tested within 14 days of collection.

Synonyms:

- Hb
- Arsenic
- Lead
- Mercury
- Mercury concentration
- Pb
- Urine concentration
- Urine AS
- Urine AS concentration
- LAB3234-VML
- LAB3234VML

SPECIMEN REQUIREMENTS

Patient Preparation:

Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, non-essential over-the-counter medications (upon the advice of their physician), and avoid shellfish and seafood for 48 to 72 hours. High concentrations of iodine may interfere with elemental testing. Collection of urine specimens from patients receiving iodinated or gadolinium-based contrast media should be avoided for a minimum of 72 hours post-exposure. Collection from patients with impaired kidney function should be avoided for a minimum of 14 days post- contrast media exposure.

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container and should be refrigerated during collection. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately if tested within 14 days of collection.

Specimen Preparation:

Transfer 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 2 mL)

Unacceptable Conditions:

Urine collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Acid preserved urine. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element-free transport tube (with the exception of the original device).

Storage/Transport Temperature:

Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):

Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Performed:

Sun-Sat

Remarks:

Trace Elements requisition form may be required (ARUP form #32990-Barcode; #32991-No Barcode). Record total volume and collection time interval on transport tube and on test request form.

ORDERING

Ordering Recommendations:

Useful in the assessment of acute and chronic exposure to arsenic, mercury, and lead. The preferred test for the assessment of lead exposure is Lead, Blood (Venous) (0020098). For occupational exposure, consider Lead, Industrial Exposure Panel, Adults (0025016) and/or Cadmium Exposure Panel - OSHA (0025013).

Performed:

Sun-Sat

Methodology:

Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:

1-5 days

Notes:

If total arsenic concentration is found to be elevated based on reference intervals, then Arsenic, Fractionated, will be added to determine the proportion of organic, inorganic, and methylated forms. Additional charges apply.

RESULTS INTERPRETATION

</table>

Interpretive Data:

Quantification of urine excretion rates before or after chelation therapy has been used as an indicator of lead exposure. Urinary excretion of >125 mg of lead per 24 hours is usually associated with related evidence of lead toxicity.

Urinary mercury levels predominantly reflect acute or chronic elemental or inorganic mercury exposure. Urine concentrations in unexposed individuals are typically less than 10 µg/L. 24 hour urine concentrations of 30 to 100 µg/L may be associated with subclinical neuropsychiatric symptoms and tremor while concentrations greater than 100 µg/L can be associated with overt neuropsychiatric disturbances and tremors. Urine mercury levels may be useful in monitoring chelation therapy.

The ACGIH Biological Exposure Index (BEI) for arsenic in urine is 35 µg/L. The ACGIH BEI is based on the sum of inorganic and methylated species. For specimens with elevated total arsenic results, fractionation is automatically performed to determine the proportions of inorganic, methylated and organic species.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative Inductively Coupled Plasma-Mass Spectrometry

ADDITIONAL INFORMATION

CPT Codes:

82175; 83655; 83825; if reflexed, add 82175

Section:

RF-ARUP

Remarks:

Trace Elements requisition form may be required (ARUP form #32990-Barcode; #32991-No Barcode). Record total volume and collection time interval on transport tube and on test request form.

Notes:

If total arsenic concentration is found to be elevated based on reference intervals, then Arsenic, Fractionated, will be added to determine the proportion of organic, inorganic, and methylated forms. Additional charges apply.

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container and should be refrigerated during collection. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately if tested within 14 days of collection.

Specimen Preparation:

Transfer 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 2 mL)

Patient Preparation:

Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, non-essential over-the-counter medications (upon the advice of their physician), and avoid shellfish and seafood for 48 to 72 hours. High concentrations of iodine may interfere with elemental testing. Collection of urine specimens from patients receiving iodinated or gadolinium-based contrast media should be avoided for a minimum of 72 hours post-exposure. Collection from patients with impaired kidney function should be avoided for a minimum of 14 days post- contrast media exposure.

Unacceptable Conditions:

Urine collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Acid preserved urine. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element-free transport tube (with the exception of the original device).

Stability (from collection to initiation):

Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated. Also acceptable: Room temperature or frozen.

Ordering Recommendations:
Useful in the assessment of acute and chronic exposure to arsenic, mercury, and lead. The preferred test for the assessment of lead exposure is Lead, Blood (Venous) (0020098). For occupational exposure, consider Lead, Industrial Exposure Panel, Adults (0025016) and/or Cadmium Exposure Panel - OSHA (0025013).

Interpretive Data:
Quantification of urine excretion rates before or after chelation therapy has been used as an indicator of lead exposure. Urinary excretion of >125 mg of lead per 24 hours is usually associated with related evidence of lead toxicity.

Urinary mercury levels predominantly reflect acute or chronic elemental or inorganic mercury exposure. Turn Around Time:
1 day

Methodology:
HPLC

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Diagnosis of Diabetes: Diabetic - =/> 6.5% Pre-diabetic - 5.7 - 6.4% Non-diabetic - =/< 5.6% Glycemic Targets for Type I and Type II Diabetes: Non-pregnant Adults - < 7.0% Pregnant Adults - < 6.0% Children and Adolescents - < 7.5%

Interpretive Data:
Hemoglobin variants have no effect on the assay when they exist in the heterozygous state. In the homozygous states, there is virtually no HbA present, and therefore no HbA1c present. Any condition that alters the life span of the red blood cells has the potential to alter the HbA1c level, such as medications (dapsone, antiretrovirals), recent transfusion, G6PD, hereditary spherocytosis. HbF > 30% will also interfere with measurement.

This test is used in the diagnosis and monitoring of diabetes mellitus.

Interpretive Data:
Hemoglobin variants have no effect on the assay when they exist in the heterozygous state. In the homozygous states, there is virtually no HbA present, and therefore no HbA1c present. Any condition that alters the life span of the red blood cells has the potential to alter the HbA1c level, such as medications (dapsone, antiretrovirals), recent transfusion, G6PD, hereditary spherocytosis. HbF > 30% will also interfere with measurement.

Reference Interval:
Diagnosis of Diabetes: Diabetic - =/> 6.5% Pre-diabetic - 5.7 - 6.4% Non-diabetic - =/< 5.6% Glycemic Targets for Type I and Type II Diabetes: Non-pregnant Adults - < 7.0% Pregnant Adults - < 6.0% Children and Adolescents - < 7.5%

Additional Information:
This test is not recommended for newborns and pregnant patients in 2nd or 3rd trimester.

Methodology:
HPLC

Hemoglobin A2, whole blood

LAB3067

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB3067, HA2, HbA2, Hgb A2
- LAB3067-VML
- LAB3067VML

Turn Around Time:
7 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Transport whole blood in original tube (Minimum: 1mL)

Pediatric Collection:
Lavender microtainer (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 1 week

Specimen:
Blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
In laboratory testing to confirm a diagnosis of a beta-thalassemia trait diagnosis, Hb A2 levels should be considered in conjunction with family history and additional laboratory data, including serum iron and iron binding capacity, red cell morphology, hemoglobin, hematocrit, and mean corpuscular volume (MCV). Patients with a combination of iron deficiency and beta-thalassemia may have a normal A[2] level. In these cases, elevated A[2] level cannot be used to screen for beta-thalassemia in these cases.

Synonyms:

- LAB3067, HA2, HbA2, Hgb A2
- LAB3067-VML
- LAB3067VML

Performed:
Daily

Turn Around Time:
7 days

Methodology:
HPLC

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Normal: 2.0 - 3.8% Borderline: 3.9 - 4.5% Abnormal: 4.6 - 7.9%

Interpretive Data:
Hemoglobin A2 results less than 2.0% might be nonspecific anemia or associated with Hemoglobin A2 prime (HbA2') and other delta chain variants. Elevated Hemoglobin A2 may be seen in beta thalassemia.

Methodology:
HPLC

Heparin Induced Thrombocytopenia ELISA

LAB766

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB766, Anti-Heparin PF4 Antibodies, Anti-Heparin Antibodies, Heparin Induced Thrombocytopenia Antibodies, HIT
- LAB766-VML
- LAB766VML

Turn Around Time:

1 day

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB766, Anti-Heparin PF4 Antibodies, Anti-Heparin Antibodies, Heparin Induced Thrombocytopenia Antibodies, HIT
- LAB766-VML
- LAB766VML

Performed:
Daily

Turn Around Time:
1 day

Methodology:
ELISA (Enzyme-linked Immunosorbent Assay)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Negatuve

Interpretive Data:
The presence of immune complexes or other immunoglobulin aggregates in the plasma may cause an increase in non-specific binding and produce false positive results. The PF4:PVS complexes used in this assay may differ slightly from those created by PF4:Heparin. Therefore, it is possible that some antibodies could react with PVS complexes that do not react with heparin complexes.

Methodology:
ELISA (Enzyme-linked Immunosorbent Assay)

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
The presence of immune complexes or other immunoglobulin aggregates in the plasma may cause an increase in non-specific binding and produce false positive results. A variety of antibodies which include know antibodies to platelet alloantigens, platelet auto antibodies, antibodies to HLA class 1 and anti-fheumatoid factor do not cross react with the target antigen in the microwells.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

Red tube (no gel)

Synonyms:

- LAB551, HAV, Hep A Panel
- LAB551-VML
- LAB551VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Ambient (15-25°C): 4 days, Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
These tests are used as an aid in the diagnosis of current or previous hepatitis A infection, and to determine immune response to HAV vaccine.

Synonyms:

- LAB551, HAV, Hep A Panel
- LAB551-VML
- LAB551VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Chemiluminescent Immunoassay

Components:
Hepatitis A Total Hepatitis A IgM

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The presence of hepatitis A IgM indicates current infection. A positive hepatitis A total antibody in the absence of IgM indicates past infection or vaccine-induced immunity.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

Additional Information:
NA

Components:
Hepatitis A Total Hepatitis A IgM

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Preferred Collection Volume:
Whole Blood: 1.5 mL

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

Patient Preparation:
NA

Specimen:
Serum or plasma

Reasons for Rejection:
Gross hemolysis, gross lipemia, bacterial contamination

Components:
Hepatitis A Total Hepatitis A IgM

Stability:
Ambient (15-25°C): 4 days, Refrigerated (2-8°C): 7 days

Storage/Transport Temperature:
Refrigerated (2-8°C)

Synonyms:

- LAB551, HAV, Hep A Panel
- LAB551-VML
- LAB551VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 Day

Ordering Indicators:
These tests are used as an aid in the diagnosis of current or previous hepatitis A infection, and to determine immune response to HAV vaccine.

Interpretive Data:
The presence of hepatitis A IgM indicates current infection. A positive hepatitis A total antibody in the absence of IgM indicates past infection or vaccine-induced immunity.

Hepatitis A Total Antibodies, serum or plasma

LAB797

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB797, HAT, Hepatitis A IgG Antibody
- LAB797-VML
- LAB797VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Ambient (15-25°C): 4 days, Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light blue tube (Sodium citrate) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used to detect serologic response to recent or past exposure to hepatitis A virus or HAV vaccination.

Synonyms:

- LAB797, HAT, Hepatitis A IgG Antibody
- LAB797-VML
- LAB797VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Chemiluminescent Immunoassay

Components:
Hepatitis A Total Ab

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
This assay detects the presence of anti-hepatitis A virus (anti-HAV) total (both IgG and IgM combined). A positive result indicates that the patient had hepatitis A either recently or in the past or immunity to hepatitis A from vaccination.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light blue tube (Sodium citrate) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

Additional Information:
This test detects both IgG and IgM antibodies.

Components:
Hepatitis A Total Ab

Resulting Laboratory:
Vanderbilt Medical Laboratories

Hepatitis B Virus (HBV) by Quantitative PCR

LAB951

ORDERING INFO

Collect:

Plasma Preparation Tube (PPT) [EDTA]

Synonyms:

- LAB951, HBV DNA by PCR, HBV DNA quant, HBD
- LAB951-VML
- LAB951VML

Turn Around Time:

72 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Plasma Preparation Tube (PPT) [EDTA]

Specimen Preparation:

PPT tube must be centrifuged and plasma removed within 24 hours of collection. (Min 0.8mL Plasma)

Pediatric Collection:

Lavender microtainer (EDTA) or Red microtainer (Serum)

Storage/Transport Temperature:

Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Blood: Up to 24 hours at Ambient (15-25°C), 6 days Refrigerated (2-8°C) once spun and plasma/serum separated.

Specimen:

Plasma, Serum

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

HBV is one of the leading causes of chronic hepatitis, cirrhosis, and hepatocellular carcinoma. More than 2 billion people are infected worldwide and it is responsible for 1 million deaths annually. In developed countries, HBV is a blood-borne viral infection transmitted via sexual activity, injection-drug use or occupational exposure. Almost all vertical transmission (mother to infant) of HBV has been eliminated in the United States due to the institution of an aggressive HBV vaccination program and the immunoprophylactic treatment of infants born to HBsAg positive mothers. Chronic HBV patients may go on to develop more severe conditions such as cirrhosis, hepatocellular carcinoma, liver failure and other complications. There have been recent advances in antiviral therapy with the development of new nucleoside analogues. This has supported the need for HBV viral quantification for the monitoring of treatment.
Click here to print the Molecular Diagnostics requisition.

Synonyms:

- LAB951, HBV DNA by PCR, HBV DNA quant, HBD
- LAB951-VML
- LAB951VML

Performed:

Monday - Friday

Turn Around Time:
72 hours

Methodology:
PCR (Polymerase Chain Reaction)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
The quantitative range of this assay is 1.00-9.00 log IU/mL (10-1,000,000,000 IU/mL). An interpretation of "Not Detected" does not rule out the presence of inhibitors in the patient specimen or HBV DNA concentration below the level of detection of the test. Care should be taken when interpreting any single viral load determination. This assay should not be used for blood donor screening, associated reentry protocols, or for screening human cell, tissues and cellular tissue-based products (HCT/P).

Methodology:
PCR (Polymerase Chain Reaction)

2mL Plasma, 2mL Serum

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

Patient Preparation:
N/A

Specimen:
Plasma, Serum

Reasons for Rejection:
Specimen not received within 24 hours unspun, Incorrect collection device (i.e. collected in an incorrect vacutainer), Quantity not sufficient

Components:
N/A

Stability:
Blood: Up to 24 hours at Ambient (15-25°C), 6 days Refrigerated (2-8°C) once spun and plasma/serum separated.

Storage/Transport Temperature:
Ambient (15-25°C)

Synonyms:

- LAB951, HBV DNA by PCR, HBV DNA quant, HBD
- LAB951-VML
- LAB951VML

Performed:
Monday - Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
72 hours

Ordering Indicators:
HBV is one of the leading causes of chronic hepatitis, cirrhosis, and hepatocellular carcinoma. More than 2 billion people are infected worldwide and it is responsible for 1 million deaths annually. In developed countries, HBV is a blood-borne viral infection transmitted via sexual activity, injection-drug use or occupational exposure. Almost all vertical transmission (mother to infant) of HBV has been eliminated in the United States due to the institution of an aggressive HBV vaccination program and the immunoprophylactic treatment of infants born to HBsAg positive mothers. Chronic HBV patients may go on to develop more severe conditions such as cirrhosis, hepatocellular carcinoma, liver failure and other complications. There have been recent advances in antiviral therapy with the development of new nucleoside analogues. This has supported the need for HBV viral quantification for the monitoring of treatment.
Click here to print the Molecular Diagnostics requisition.

Interpretive Data:
The quantitative range of this assay is 1.00-9.00 log IU/mL (10-1,000,000,000 IU/mL). An interpretation of "Not Detected" does not rule out the presence of inhibitors in the patient specimen or HBV DNA concentration below the level of detection of the test. Care should be taken when interpreting any single viral load determination. This assay should not be used for blood donor screening, associated reentry protocols, or for screening human cell, tissues and cellular tissue-based products (HCT/P).

Reference Interval:
Not detected

Additional Information:
N/A

Methodology:
PCR (Polymerase Chain Reaction)

Hepatitis B Virus Core Antibodies (Total), Serum or Plasma

LAB1242

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB1242, HBC, Hepatitis B Core Total Antibody
- LAB1242-VML
- LAB1242VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 4 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light blue tube (Sodium citrate) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This is part of a screening protocol for hepatitis B infection, used (in conjuction with other hepatitis B markers) to differentiate between past, chronic, and active hepatitis B infections.

Synonyms:

- LAB1242, HBC, Hepatitis B Core Total Antibody
- LAB1242-VML
- LAB1242VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Chemiluminescent Immunoassay

Components:
Hepatitis B Core Total Antibody

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Interpret in conjunction with other Hepatitis B serologic markers.

Methodology:
Chemiluminescent Immunoassay

Hepatitis B Virus Genotype by Sequencing

LAB3752

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), serum separator tube, or plasma preparation tube.

Synonyms:

- Adefovir
- Entecavir
- HBsAg mutations
- HBV drug resistance testing
- HBV Genotype
- HBV Genotyping
- HBV Resistance
- HBV Resistance Sequencing
- HBV Sequencing
- Lamivudine
- Telbivudine
- Tenofovir
- Hepatitis B Drug Resistance Panel
- LAB3752-VML
- LAB3752VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), serum separator tube, or plasma preparation tube.

Specimen Preparation:
Separate serum or plasma from cells within 24 hours. Transfer 2 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Heparinized specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: 6 weeks

Performed:
Tue, Fri

ORDERING

Synonyms:

- Adefovir
- Entecavir
- HBsAg mutations
- HBV drug resistance testing
- HBV Genotype
- HBV Genotyping
- HBV Resistance
- HBV Resistance Sequencing
- HBV Sequencing
- Lamivudine
- Telbivudine
- Tenofovir
- Hepatitis B Drug Resistance Panel
- LAB3752-VML
- LAB3752VML

Ordering Recommendations:
Determine antiviral drug resistance by DNA sequencing.

Performed:
Tue, Fri

Methodology:
Polymerase Chain Reaction/Sequencing

Reported:
7-10 days

Notes:
This test may be unsuccessful if the HBV viral load is less than log 3.0 or 1,000 IU/mL of plasma.

RESULTS INTERPRETATION

Reference Interval:
None

Interpretive Data:
Both the HBV RT polymerase and the HBsAg encoding regions are sequenced. Resistance and surface antigen mutations are reported. In addition, the major HBV genotypes are identified. Mutations in viral sub-populations below 20 percent of total may not be detected.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Polymerase Chain Reaction/Sequencing

Hepatitis C IgG with reflex PCR, serum or plasma

LAB6233

ORDERING INFO

Collect:

HCV IgG: Red tube (no gel)

PCR: Lavender tube (EDTA)

Synonyms:

- LAB6233, HCV, HCV Ab, HCV with reflex
- LAB6233-VML
- LAB6233VML

Turn Around Time:

1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:

NA

Collect:

HCV IgG: Red tube (no gel)

PCR: Lavender tube (EDTA)

Specimen Preparation:

HCV IgG: Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma) PCR: Store EDTA tube refrigerated

Pediatric Collection:

HCV IgG: Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA). PCR: Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:

Refrigerated (2-8°C)

Performed:

Daily

Stability:

Ambient (15-25°C): 4 days, Refrigerated (2-8°C): 7 days

Specimen:

HCV IgG: Serum or plasma PCR: plasma

Alternate Specimen:

HCV IgG: Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light blue tube (Sodium citrate) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used as an aid in the diagnosis of HCV infection.

Synonyms:

- LAB6233, HCV, HCV Ab, HCV with reflex
- LAB6233-VML
- LAB6233VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Chemiluminescent Immunoassay

Components:
Hepatitis C Ab

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result indicates past (resolved) or chronic HCV infection. For specimens with positive HCV antibodies, an HCV viral load is reflexively performed to evaluate for active infection. A negative result does not exclude possibility of current HCV infection.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
HCV IgG: Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light blue tube (Sodium citrate) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

Additional Information:
If Hep C Ab is positive, reflex to PCR will be added, along with charges for CPT 87522; Hep C PCR is performed Monday - Friday.

Components:
Hepatitis C Ab

Resulting Laboratory:
Vanderbilt Medical Laboratories

Hepatitis C Virus (HCV) by Quantitative PCR

LAB1834

ORDERING INFO

Collect:

Blood: Plasma Preparation Tube (PPT) (EDTA)

Synonyms:

- LAB1834, HCQ, HCV RNA quant, Hepatitis C RNA Quant
- LAB1834-VML
- LAB1834VML

Turn Around Time:

72 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Blood: Plasma Preparation Tube (PPT) (EDTA)

Specimen Preparation:

Blood: draw 4.0ml of whole blood (Lavender tube [EDTA] or Red tube [Serum]), deliver to lab within 24hrs at Ambient (15-25°C). (Min 0.7mL Plasma), (Min 0.7mL Serum)

Pediatric Collection:

Lavender microtainer (EDTA) or Red microtainer (Serum)

Storage/Transport Temperature:

Blood: Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Blood: Up to 24 hours at Ambient (15-25°C), 6 days at Refrigerated (2-8°C) once spun and plasma/serum separated.

Specimen:

Blood in a Lavender tube (EDTA) or Red tube (Serum)

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

It is necessary to quantitate HCV RNA once a patient has been diagnosed with an HCV infection to provide base-line levels prior to starting drug therapy. HCV can be treated with interferon-a alone or in combination with ribavirin. The amount of HCV RNA in the plasma (viral load) correlates to the response to therapy and the stage of HCV infection. HCV quantification will track levels to monitor the response to drug therapy. With successful drug therapy the viral load decreases and in some patients reaches undetectable levels. Nucleic acid techniques are currently the only reliable laboratory test for HCV quantitation in clinical specimens.

Synonyms:

- LAB1834, HCQ, HCV RNA quant, Hepatitis C RNA Quant
- LAB1834-VML
- LAB1834VML

Performed:

Monday - Friday

Turn Around Time:

72 Hours

Methodology:
PCR (Polymerase Chain Reaction)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not Detected

Interpretive Data:
Normal range for this assay is "Not Detected." The quantitative range of this assay is 10 -100,000,000 IU/mL (1.0 -8.0 log IU/mL). Lower limit of quantitation (LLoQ): 10 IU/mL (1.0 log IU/mL) LLoQ values do not apply to diluted specimens. A result of "Not Detected" does not rule out the presence of inhibitors in the patient specimen or hepatitis C virus RNA concentrations below the level of detection of the test. Care should be taken when interpreting any single viral load determination. This test should not be used for blood donor screening, associated reentry protocols, or for screening human cell, tissues and cellular tissue-based products (HCT/P).

Methodology:
PCR (Polymerase Chain Reaction)

Specimen:

Plasma (EDTA)

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

HCV genotyping is recommended after diagnosis of HCV to help in selecting a therapeutic regimen and also to determine expected virological response and therefore outcome of therapy. The current guidelines for therapy suggest that patients infected with genotype 1 follow a longer course of therapy (48 weeks) and a combination therapy than those of other genotypes. Amplifying and sequencing the 5' untranslated region (UTR) region of HCV genome allows the HCV genotype to be determined by comparing to prototypic HCV genotypes in a database.

Synonyms:

- LAB915, HC5, Hep C typing, HCV typing, HCV GT
- LAB915-VML
- LAB915VML

Performed:

Weekly

Turn Around Time:
7-10 Days

Methodology:
PCR (Polymerase Chain Reaction)

Components:
Will determine one of the following HCV Genotypes: 1a, 1b, 2, 2a/c, 2b, 3, 4, 5, and 6.

RESULTS INTERPRETATION

Reference Interval:
HCV Genotype

Interpretive Data:
Hepatitis C viral RNA is tested using reverse-transcription polymerase chain reaction (RT-PCR) to amplify a specific portion of the 5' untranslated region (5' UTR) of the viral genome. The amplified nucleic acid is sequenced bi-directionally using dye-terminator chemistry (ABI). Sequencing data is compared to a database of characterized sequences. Isolates of hepatitis C virus are grouped into six major genotypes (1-6). These genotypes are subtyped according to sequence characteristics. Due to high conservation of the 5' untranslated region of the HCV genome, this test has limitations in differentiating subtype 1a from 1b. Therefore, these subtypes will be reported as "1a or 1b." In rare instances, Type 6 virus may be misclassified as Type 1. This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
PCR (Polymerase Chain Reaction)

ADDITIONAL INFORMATION

Section:
Molecular Infectious Disease

HCV genotyping is recommended after diagnosis of HCV to help in selecting a therapeutic regimen and also to determine expected virological response and therefore outcome of therapy. The current guidelines for therapy suggest that patients infected with genotype 1 follow a longer course of therapy (48 weeks) and a combination therapy than those of other genotypes. Amplifying and sequencing the 5' untranslated region (UTR) region of HCV genome allows the HCV genotype to be determined by comparing to prototypic HCV genotypes in a database.

Interpretive Data:
Hepatitis C viral RNA is tested using reverse-transcription polymerase chain reaction (RT-PCR) to amplify a specific portion of the 5' untranslated region (5' UTR) of the viral genome. The amplified nucleic acid is sequenced bi-directionally using dye-terminator chemistry (ABI). Sequencing data is compared to a database of characterized sequences. Isolates of hepatitis C virus are grouped into six major genotypes (1-6). These genotypes are subtyped according to sequence characteristics. Due to high conservation of the 5' untranslated region of the HCV genome, this test has limitations in differentiating subtype 1a from 1b. Therefore, these subtypes will be reported as "1a or 1b." In rare instances, Type 6 virus may be misclassified as Type 1. This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Hepatitis Delta Virus (HDV), IgM Antibody, EIA

LAB1240

ORDERING INFO

Collect:
Plain red or serum separator tube (SST).

Synonyms:

- LAB1240-VML
- LAB1240VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube (SST).

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Varies

ORDERING

Synonyms:

- LAB1240-VML
- LAB1240VML

Ordering Recommendations:
Determine whether HDV infection is acute rather than chronic. Consider ordering HBV IgM core antibody to determine whether HDV infection is a coinfection or a superinfection with HBV.

Performed:
Varies

Methodology:
Enzyme Immunoassay

Reported:
3-8 days

RESULTS INTERPRETATION

Herpes Simplex Virus (HSV-1/HSV-2) Subtype by Qualitative PCR

LAB3072

ORDERING INFO

Collect:

Blood: Red tube (Serum)

Swab: Universal /Viral Transport Media (UTM/VTM)

CSF: Sterile Container

Synonyms:

- LAB3072, Herpes Simplex Virus DNA, HSV CSF, HSV DNA, HSD
- LAB3072-VML
- LAB3072VML

Turn Around Time:

1 - 2 days

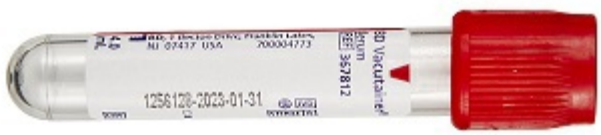
SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Blood: Red tube (Serum)



Swab: Universal /Viral Transport Media (UTM/VTM)

CSF: Sterile Container

Specimen Preparation:

Blood: draw 4.0ml of whole blood (Red Tube [Serum]), deliver to lab within 24hrs at Ambient (15-25°C). Swab: Swab site and place in either UTM or VTM, deliver to lab within 24hrs at Ambient (15-25°C). CSF: Collect in sterile container and deliver to lab within 24hrs at Ambient (15-25°C) (Min 1.0mL Serum), (Min 0.2mL UTM/VTM), (Min 0.2mL CSF)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Blood: Ambient (15-25°C); Swabs: Ambient (15-25°C). CSF: Ambient (15-25°C)

Performed:

Daily

Stability:

Blood: Up to 24 hours at Ambient (15-25°C), 6 days at Refrigerated (2-8°C) once spun and serum separated. Swabs: collected in UTM or VTM within 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C). CSF: 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C), 4 weeks at Frozen(<=-20°C).

Specimen:

Blood in a Red tube (Serum); Swab collected in UTM/VTM; CSF

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

PCR is substantially more sensitive than viral culture and test of choice for the diagnosis of suspected HSV infections of the central nervous system (encephalitis and meningitis). CSF cultures are generally of limited value in the detection of HSV. PCR is also the test of choice for detection of HSV viremia. Though culture isolation serves as a reliable means of demonstrating HSV in oral and genital lesions, PCR displays increased sensitivity at mucocutaneous sites.

Synonyms:

- LAB3072, Herpes Simplex Virus DNA, HSV CSF, HSV DNA, HSD
- LAB3072-VML
- LAB3072VML

Performed:

Daily

Turn Around Time:

1 - 2 days

Methodology:

PCR - Polymerase Chain Reaction

Components:

None

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
Assay sensitivity for virus detection in CSF may be low shortly after symptom development. Consider repeat testing for patients with a negative HSV PCR result but exhibiting a compatible clinical syndrome or neuroimaging findings.

Methodology:
PCR - Polymerase Chain Reaction

ADDITIONAL INFORMATION

Components:
None

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Blood: Red tube (Serum)

Swab: Universal /Viral Transport Media (UTM/VTM)

CSF: Sterile Container

Specimen Preparation:
Blood: draw 4.0ml of whole blood (Red Tube [Serum]), deliver to lab within 24hrs at Ambient (15-25°C). Swab: Swab site and place in either UTM or VTM, deliver to lab within 24hrs at Ambient (15-25°C). CSF: Collect in sterile container and deliver to lab within 24hrs at Ambient (15-25°C) (Min 1.0mL Serum), (Min 0.2mL UTM/VTM), (Min 0.2mL CSF)

Pediatric Collection:
N/A

Preferred Collection Volume:
1mL Serum; 200ul UTM/VTM; 200ul CSF

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

Patient Preparation:
N/A

Specimen:
Blood in a Red tube (Serum); Swab collected in UTM/VTM; CSF

Reasons for Rejection:
Specimen collected incorrectly (i.e. Whole Blood sent in wrong blood vacutainer); alternative specimen type/source sent without Medical Director approval

Components:
None

Stability:
Blood: Up to 24 hours at Ambient (15-25°C), 6 days at Refrigerated (2-8°C) once spun and serum separated. Swabs: collected in UTM or VTM within 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C). CSF: 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C), 4 weeks at Frozen(<=-20°C).

Storage/Transport Temperature:
Blood: Ambient (15-25°C); Swabs: Ambient (15-25°C). CSF: Ambient (15-25°C)

Herpes Simplex Virus Type 1 and Type 2 IgG, serum or plasma

LAB507

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB507, HGG, HSV, HSV IgG
- LAB507-VML
- LAB507VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used to determine past HSV exposure.

Synonyms:

- LAB507, HGG, HSV, HSV IgG
- LAB507-VML
- LAB507VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
HSV Type 1 IgG HSV Type 2 IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Positive results indicate previous HSV infection.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

Additional Information:
Detection of IgG antibodies to HSV should not be used as the primary means of diagnosis of HSV infection. For patients with suspected acute HSV, a clinical specimen should be obtained and submitted for HSV PCR.

Components:
HSV Type 1 IgG HSV Type 2 IgG

Resulting Laboratory:
Vanderbilt Medical Laboratories

Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgG & IgM (CSF) with Reflex to Type 1 & 2 Glycoprotein G-Specific Ab, IgG

LAB3161

ORDERING INFO

Collect:
CSF.

Synonyms:

- HSV 1,2 and glycoprotein reflex
- HSV glycoprotein G CSF
- HSV glycoprotein G-based type-specific CSF
- Herpes Simplex CSF
- HSV 1, 2 IgG IgM CSF
- HSV 1,2 glycoprotein CSF
- HSV CSF antibody
- HSV 1,2
- glycoprotein type-specific reactivity
- Herpes Simplex Antibodies, IgG IgM CSF
- LAB3161-VML
- LAB3161VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 1 mL CSF to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimen types other than CSF. Contaminated, heat-inactivated, or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- HSV 1,2 and glycoprotein reflex
- HSV glycoprotein G CSF
- HSV glycoprotein G-based type-specific CSF
- Herpes Simplex CSF
- HSV 1, 2 IgG IgM CSF
- HSV 1,2 glycoprotein CSF
- HSV CSF antibody
- HSV 1,2
- glycoprotein type-specific reactivity
- Herpes Simplex Antibodies, IgG IgM CSF
- LAB3161-VML
- LAB3161VML

Ordering Recommendations:
Not recommended for herpes simplex virus (HSV) testing; lacks adequate predictive value for acute infection. Preferred testing is Herpes Simplex Virus (HSV-1/HSV-2) Subtype by PCR (2010095).

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Chemiluminescent Immunoassay /Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-2 days

Notes:
If HSV 1/2 IgG, CSF is greater than or equal to 1.10 IV , then HSV 1 gG-Specific IgG, CSF and HSV 2 gG-Specific IgG, CSF will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
HSV 1 and/or 2 Antibodies IgM, CSF	0.89 IV or less
HSV 1/2 Antibody Screen IgG, CSF	0.89 IV or less

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgM, CSF by ELISA	0.89 IV or less; Negative. No significant level of detectable HSV IgM antibody. 0.90-1.09 IV: Equivocal. Questionable presence of IgM antibodies. Repeat testing in 10-14 days may be helpful. 1.10 IV or greater: Positive. IgM antibody to HSV detected which may indicate a current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post infection.
Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgG, CSF	0.89 IV or less: Negative - No significant level of detectable HSV IgG antibody. 0.90-1.09 IV: Equivocal - Questionable presence of IgG antibodies. Repeat testing in 10-14 days may be helpful. 1.10 IV or greater: Positive - IgG antibody to HSV detected which may indicate a current or past HSV infection.

Methodology:

Semi-Quantitative Chemiluminescent Immunoassay /Semi-Quantitative Enzyme-Linked Immunosorbent Assay

- HerpeSelect
- HSV 1 CSF
- HSV type 1 glycoprotein G, CSF
- HSV typing CSF
- HSV-1
- LAB3162-VML
- LAB3162VML

Ordering Recommendations:
Not a standalone test. Molecular testing is preferred; refer to Herpes Simplex Virus (HSV-1/HSV-2) Subtype by PCR (2010095).

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

0.89 IV or less	Negative - No significant level of detectable IgG antibody to HSV type 1 glycoprotein G.
0.90-1.10 IV	Equivocal - Questionable presence of IgG antibody to HSV type 1. Repeat testing in 10-14 days may be helpful.
1.11 IV or greater	Positive - IgG antibody to HSV type 1 glycoprotein G detected, which may indicate a current or past infection.

Interpretive Data:

Individuals infected with HSV may not exhibit detectable IgG antibody to type-specific HSV antigens 1 and 2 in the early stages of infection. Detection of antibody presence in these cases may only be possible using a nontype-specific screening test.

The detection of antibodies to herpes simplex virus in CSF may indicate central nervous system infection. However, consideration must be given to possible contamination by blood or transfer of serum antibodies across the blood-brain barrier.

Fourfold or greater rise in CSF antibodies to herpes on specimens at least 4 weeks apart are found in 74-94 percent of patients with herpes encephalitis. Specificity of the test based on a single CSF testing is not established. Presently PCR is the primary means of establishing a diagnosis of herpes encephalitis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

High Molecular Weight Kininogen (HMWK) Screen

LAB1115

ORDERING INFO

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Synonyms:

- LAB1115, HMW, High Molecular Weight Kininogen Screen
- LAB1115-VML
- LAB1115VML

Turn Around Time:

1-3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: Two 3.7 mL Light blue tubes (3.2% Sodium Citrate); Neonatal: Two 1.8mL Light blue tubes (3.2% Sodium Citrate)

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
The HMW kininogen screen provides insight into the etiology of a prolonged partial thromboplastin time (PTT) when other factors have been reported as normal. Note: decreased HMW kininogen is not associated with a bleeding phenotype.

Synonyms:

- LAB1115, HMW, High Molecular Weight Kininogen Screen
- LAB1115-VML
- LAB1115VML

Performed:
Daily

Turn Around Time:
1-3 days

Methodology:
Clotting

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
The result of the high molecular weight kininogen screening assay indicates the patient does not have a HMWK deficiency.

Interpretive Data:
Direct thrombin (IIa) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. The presence of a strong lupus anticoagulant may interfer with the assay. The presence of Hemlibra (emicizumab-kxwh) may cause a the initial PTT result to be normal.. (DOI: 10.1111/hae.13903)

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Performed daily from 7:00 AM to 4:00 PM. Sample must be received in the laboratory by 2:00 PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call (refer to Synergy for contact information).

Components:

High Risk Human Papillomavirus (HPV) with 16 and 18 Genotype by PCR

LAB3357

ORDERING INFO

Collect:

ThinPrep vial

Synonyms:

- LAB3357, HPP, HPV DNA, Human Papillomavirus PCR, High Risk HPV
- LAB3357-VML
- LAB3357VML

Turn Around Time:

72 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

ThinPrep vial

Specimen Preparation:

(Min 1.0mL ThinPrep)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Ambient (15-25°C): 4 months

Specimen:

Endocervical brush

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

More than 70 types of HPV have been identified, and are generally classified as high-risk or low-risk depending on their known association or lack of association with cancer and its precursor lesion, high-grade cervical intraepithelial neoplasia (CIN 2-3). Prospective studies (age 16-60 years) have shown that 15-28% of HPV DNA positive women developed squamous intraepithelial lesions (SIL) suggestive of CIN 1-3 or cancer within 2 years compared to only 1-3% of HPV DNA negative women. Although current scientific literature suggests that persistent infection with high-risk HPV is the main risk factor for development of high-grade cervical neoplasia and cancer, apparent persistence may represent continuous infection with a single HPV type, with multiple HPV types, or reinfection. Nonetheless, women who are repeatedly Pap negative and HR HPV negative appear to be at low risk for having or developing cervical precancerous lesions.

Synonyms:

- LAB3357, HPP, HPV DNA, Human Papillomavirus PCR, High Risk HPV
- LAB3357-VML
- LAB3357VML

Performed:

Monday - Friday

Turn Around Time:

72 hours

Methodology:

Polymerase Chain Reaction (PCR)

Components:

None

RESULTS INTERPRETATION

Reference Interval:

HPV Type 16: Not Detected; HPV Type 18: Not Detected; Other HPV: Not Detected

Interpretive Data:

This test detects high-risk HPV types (16, 18, 31, 33, 35, 39, 45, 51, 52, 56, 58, 59, 66, and 68) and differentiates HPV 16 and 18 associated with cervical cancer and its precursor lesions. Sensitivity may be affected by specimen collection methods, stage of infection, and the presence of interfering substances. Results should be interpreted in conjunction with other available laboratory and clinical data. A negative high-risk HPV result does not exclude the presence of other high-risk HPV types. HPV testing should not be used for screening or management of atypical squamous cells of undetermined significance (ASCUS) in women under age 21.

Methodology:

Polymerase Chain Reaction (PCR)

Histamine, Plasma

LAB1033

ORDERING INFO

Collect:
Lavender (EDTA) or pink (K_2EDTA). Collect in a pre-chilled tube and on ice.

Synonyms:

- plasma histamine
- LAB1033-VML
- LAB1033VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or pink (K_2EDTA). Collect in a pre-chilled tube and on ice.

Specimen Preparation:
Centrifuge refrigerated and separate upper two-thirds of plasma within 20 minutes. If EDTA gel collection tube is used, the plasma must be collected immediately after centrifugation and frozen separately. Transfer 1 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 0.5 mL)

Unacceptable Conditions:
Lipemic or hemolyzed specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 6 hours; Frozen: 6 months

Performed:
Tue, Sat

ORDERING

Synonyms:

- plasma histamine
- LAB1033-VML
- LAB1033VML

Ordering Recommendations:
Aid in evaluation of patient with allergic signs and symptoms, such as anaphylaxis; may assist in diagnosing and monitoring of mast-cell activation disorders.

Performed:
Tue, Sat

Histamine, Urine

LAB3235

ORDERING INFO

Collect:
Random or 24-hour urine in a plastic container. Refrigerate during collection.

Synonyms:

- urine histamine
- LAB3235-VML
- LAB3235VML

SPECIMEN REQUIREMENTS

Collect:
Random or 24-hour urine in a plastic container. Refrigerate during collection.

Specimen Preparation:
Transfer a 4 mL aliquot from a well-mixed random or 24-hour collection to an ARUP Standard Transport Tube and freeze immediately. (Min: 1 mL) Record total volume and collection time interval on transport tube and test request form.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 6 hours; Frozen: 6 months

Performed:
Tue, Sat

ORDERING

Synonyms:

- urine histamine
- LAB3235-VML
- LAB3235VML

Ordering Recommendations:
Aid in evaluation of patient with allergic signs and symptoms, such as anaphylaxis. May assist when diagnosing and monitoring mast-cell activation disorders or when evaluating histamine production over a longer time frame.

Performed:
Tue, Sat

Methodology:
Quantitative Enzyme Immunoassay

Reported:
1-6 days

Notes:
If 24-hour urine is submitted, the excretion will be calculated. If random urine is submitted, the result will be reported as "Not applicable."

RESULTS INTERPRETATION

Reference Interval:
Effective February 21, 2012

Components	Reference Interval
Histamine, Urine - ratio to CRT	0-450 nmol/g crt
Histamine, Urine, Excretion - 24h	0-60 µg/day

Interpretive Data:
Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Notes:
Histone antibodies are present in 20-55% of idiopathic systemic lupus erythematosus (SLE) and 80-95% of drug-induced SLE. They occur in less than 20% of other types of connective tissue diseases.

Histone H3 K36M (RM193) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath126

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

Histoplasma Antigen, Urine

LAB6607

ORDERING INFO

Collect:
Urine Clear

Synonyms:

- Histo Ag, Urine
- LAB6607-VML
- LAB6607VML

Turn Around Time:
1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Urine Clear

Specimen Preparation:
Collect urine in sterile container, store refrigerated.

Pediatric Collection:
Urine in sterile container

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Refrigerated (2-8°C): 72 hours

Specimen:
Urine

Alternate Specimen:
NA

ORDERING

Ordering Indicators:
This test is used as an aid in the diagnosis of histoplasmosis.

Synonyms:

- Histo Ag, Urine
- LAB6607-VML
- LAB6607VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
Enzyme-linked Immunoassay

Components:
Histoplasma Ag by EIA; Histoplasma Ag value

RESULTS INTERPRETATION

Reference Interval:
Not detected; <0.20 ng/mL

Interpretive Data:
A result of >/= 0.20 ng/mL indicates the presence of Histoplasma antigen. Histoplasma antigen assay completely cross-react with Blastomyces, another endemic dimorphic fungus. Therefore, a positive urine Histoplasma Ag result does not help differentiate between histoplasmosis and blastomycosis.

Methodology:
Enzyme-linked Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
NA

Additional Information:
NA

Components:
Histoplasma Ag by EIA; Histoplasma Ag value

Resulting Laboratory:
Vanderbilt Medical Laboratories

HIV PhenoSense GT

LAB3757

ORDERING INFO

Collect:
Lavender (EDTA) or Plasma Preparation Tube (PPT).

Synonyms:

- HIV Resistance
- LAB3757-VML
- LAB3757VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or Plasma Preparation Tube (PPT).

Specimen Preparation:
Separate from cells within 6 hours of collection. Transfer 3 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 1 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Thawed specimens.

Storage/Transport Temperature:
CRITICAL FROZEN.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 2 weeks

Performed:
Varies

Remarks:
Provide patient's most recent viral load and viral load collection date.

ORDERING

Synonyms:

- HIV Resistance
- LAB3757-VML
- LAB3757VML

Ordering Recommendations:
Intended for use in patients with viral loads >=500 copies/mL. HIV-1 combined pheno- and genotyping test to provide antiretroviral susceptibility information for protease inhibitors (PI) and reverse transcriptase inhibitors (ie, NRTI and NNRTI). Preferred test for patients with known or suspected complex drug resistance patterns (eg, suboptimal virologic response to treatment and viral load rebound).

Performed:
Varies

Methodology:
Polymerase Chain Reaction/Culture

Reported:
16-25 days

Notes:
Procedure should be used for patients with documented HIV-1 infection and viral loads greater than 500 copies/mL.

RESULTS INTERPRETATION

Reference Interval:
By report

Methodology:
Polymerase Chain Reaction/Culture

ADDITIONAL INFORMATION

CPT Codes:
87900; 87901; 87903; 87904 x12

HLA-B*57:01 for Abacavir Sensitivity

LAB3760

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), or yellow (ACD Solution A or B).

Synonyms:

- Abacavir hypersensitivity genotyping
- Abacavir Sensitivity
- HLA-B 5701 Genotype, Abacavir Hypersensitivity, Saliva
- LAB3760-VML
- LAB3760VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), or yellow (ACD Solution A or B).

Specimen Preparation:
Transport 3 mL whole blood. (Min: 1 mL)

Unacceptable Conditions:
Plasma or serum. Heparinized specimens. Frozen specimens in glass collection tubes.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: 1 month.

Performed:
Varies

ORDERING

Synonyms:

- Abacavir hypersensitivity genotyping
- Abacavir Sensitivity
- HLA-B 5701 Genotype, Abacavir Hypersensitivity, Saliva
- LAB3760-VML
- LAB3760VML

Ordering Recommendations:
Standard of care prior to abacavir therapy per FDA. Predicts risk of abacavir hypersensitivity syndrome. Relevant to most populations.

Performed:
Varies

Methodology:
Polymerase Chain Reaction/Fluorescence Monitoring

Reported:
5-10 days

RESULTS INTERPRETATION

HLA-B*58:01 Genotyping, Allopurinol Hypersensitivity

LAB6249

ORDERING INFO

Collect:
Lavender (EDTA), Pink (K_2EDTA), or Yellow (ACD Solution A or B).

Synonyms:

- B58
- B5801
- HLA B58
- HLA B*58:01
- Allopurinol Hypersensitivity
- LAB6249-VML
- LAB6249VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), Pink (K_2EDTA), or Yellow (ACD Solution A or B).

Specimen Preparation:
Transport 5 mL whole blood. (Min: 3 mL)

Unacceptable Conditions:
Specimens collected in green (sodium or lithium heparin).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: Unacceptable

Performed:
Mon-Fri

ORDERING

Synonyms:

- B58
- B5801
- HLA B58
- HLA B*58:01
- Allopurinol Hypersensitivity
- LAB6249-VML
- LAB6249VML

Ordering Recommendations:
Identifies patients with increased risk for allopurinol-induced severe cutaneous adverse reactions (SCAR) based on the presence of HLA-B*58:01 allele.

Performed:
Mon-Fri

Methodology:
Polymerase Chain Reaction/Sequence-Specific Oligonucleotide Probe Hybridization

Reported:
3-7 days

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:

Characteristics: Allopurinol is the most commonly used drug for the treatment of hyperuricemia and gout. It inhibits xanthine oxidase, a key enzyme involved in uric acid formation. However, allopurinol is one of the most common causes of life-threatening severe cutaneous adverse reactions (SCAR), which include drug hypersensitivity syndrome, Stevens-Johnson syndrome (SJS) and toxic epidermal necrolysis (TEN). The presence of HLA-B*58:01 allele shows strong association with allopurinol-induced SCAR, including TEN and SJS. Although allopurinol-induced SCAR is rare with an estimated risk of 0.1-0.4 percent in allopurinol users, the severity can be high, with a mortality rate of up to 25 percent. Symptoms include rash, combined with eosinophilia, leukocytosis, fever, hepatitis and progressive kidney failure. Due to the severity of adverse reactions, it is recommended to test for the HLA-B*58:01 allele prior to initiation of the drug.
Incidence: HLA-B*58:01 allele frequency varies by ethnicity. In the US population, the highest incidence at 5.3 percent is found in Asians, 3.8 percent in African Americans, 1.45 percent in Native Hawaiians or Pacific Islanders, 1.35 percent in Hispanics, 1.19 percent in American Indians or Alaska Natives and 0.8 percent in Caucasians. Frequencies may be higher in other countries, up to 20 percent in Singapore, Taiwan and among Han Chinese, 15.4 percent in India, 14.2 percent in Hong Kong, 12 percent in China and Korea, 11 percent in Indonesia.
Cause: Allopurinol-induced SCAR, including SJS and TEN, is strongly associated with the presence of one or two copies of HLA-B*58:01 allele. The mechanism is immune mediated and involves direct interactions between the allopurine metabolite oxypurinol, and HLA-B*58:01, which may result in drug-induced changes in peptide presentation, allowing activation of self-reactive T lymphocytes.
Alleles tested: HLA-B*58:01 allele.
Clinical Sensitivity and Specificity: 71 percent sensitivity and 92 percent specificity, overall mean values from pooled populations (Yu KH et al, Int J Rheum Dis 2017). Higher in populations with increased HLA-B*58:01 allele frequency.
Methodology: PCR followed by Sequence Specific Oligonucleotide Probe Hybridization of HLA-B locus.
Analytical Sensitivity and Specificity: Greater than 99 percent.
Limitations: Copy number of HLA-B*58:01 will not be reported. Other genetic and non-genetic factors that influence allopurinol hypersensitivity are not evaluated. Other rare, or novel alleles may occur which may lead to false positive or false negative results.

Test systems were developed and their performance characteristics determined by the H&I laboratory at the University of Utah Health, under the accreditation guidelines from the American Society for Histocompatibility and Immunogenetics (ASHI).

5 - 15 µmol/L

Interpretive Data:
N/A

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Chemistry

Alternate Specimen:
N/A

Additional Information:
Specimens not placed on ice immediately may exhibit a 10-20% increase in concentration.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Deliver to lab immediately on ice. Separate plasma from cells within 6 hours of draw time. Specimens need to be spun in a refrigerated centrifuge (Min 0.5 mL).

Pediatric Collection:
1 Lavender Microtainer (EDTA)

Preferred Collection Volume:
Fill to Indicator Line

Alternate Specimen:
N/A

Patient Preparation:
N/A

Specimen:
Plasma

Reasons for Rejection:
Hemolysis, improper collection, QNS, sample outside of stability limits - Specifically, EDTA tube not stored on ice/separated from cells within 6 hours

Components:
N/A

Stability:
After separation from cells: 2° to 8°C: 14 days; Frozen: 1 year

Storage/Transport Temperature:
Place immediately on ice, deliver to lab and centrifuge, preferably at 2 8 °C.

Synonyms:

- HCB , LAB93
- LAB93-VML
- LAB93VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Homovanillic Acid (HVA), Urine

LAB401

ORDERING INFO

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Synonyms:

- 3-Methoxy-4-hydroxyphenyl acetic acid
- 4-Hydroxy-3-methoxy-benzeneacetic acid
- 4-Hydroxy-3-methoxyphenylacetic acid
- HVA
- 3-Methoxy-4-Hydroxy Phenylacetic Acid
- LAB401-VML
- LAB401VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Abstain from medications for 72 hours prior to collection.

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:
Transfer 4 mL aliquot from a well-mixed 24-hour or random collection to an ARUP Standard Transport Tube. (Min: 1 mL) Record total volume and collection time interval on transport tube and test request form.

Unacceptable Conditions:
Specimen types other than urine.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 2 weeks

Performed:
Sun, Tue, Wed, Thu, Fri, Sat

ORDERING

Synonyms:

- 3-Methoxy-4-hydroxyphenyl acetic acid
- 4-Hydroxy-3-methoxy-benzeneacetic acid
- 4-Hydroxy-3-methoxyphenylacetic acid
- HVA
- 3-Methoxy-4-Hydroxy Phenylacetic Acid
- LAB401-VML
- LAB401VML

Ordering Recommendations:
Initial test for the diagnosis and monitoring of neuroblastoma; order concurrently with Vanillylmandelic Acid (VMA), Urine (0080421).

Performed:
Sun, Tue, Wed, Thu, Fri, Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Moderately elevated HVA (homovanillic acid) may be caused by a variety of factors such as essential hypertension, intense anxiety, intense physical exercise, and numerous drug interactions (including some over-the-counter medications and herbal products).

Medications that may interfere with catecholamines and their metabolites include amphetamines and amphetamine-like compounds, appetite suppressants, bromocriptine, buspirone, caffeine, chlorpromazine, clonidine, disulfiram, diuretics (in doses sufficient to deplete sodium), epinephrine, glucagon, guanethidine, histamine, hydrazine derivatives, imipramine, levodopa (L-dopa, Sinemet®), lithium, MAO inhibitors, melatonin, methyldopa (Aldomet®), morphine, nitroglycerin, nose drops, propafenone (Rythmol), radiographic agents, rauwolfia alkaloids (Reserpine), and vasodilators. The effects of some drugs on catecholamine metabolite results may not be predictable.

RESULTS INTERPRETATION

</td></tr>
</table>

Interpretive Data:

Homovanillic acid (HVA) results are expressed as a ratio to creatinine excretion (mg/g CRT). No reference interval is available for results reported in units of mg/L. Slight or moderate increases in catecholamine metabolites may be due to extreme anxiety, essential hypertension, intense physical exercise, or drug interactions. Significant increase of one or more catecholamine metabolites (several times the upper reference limit) is associated with an increased probability of a secreting neuroendocrine tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Hormone Fine Needle Aspiration (FNA), fine needle aspiration

LAB3143

ORDERING INFO

Collect:
BD Vacutainer serum tube

Synonyms:

- LAB3143, HFNA, FNA, FNA PTH, FNA, THG, FNH
- LAB3143-VML
- LAB3143VML

Turn Around Time:
3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
BD Vacutainer serum tube

Specimen Preparation:
A saline control tube is required for analysis. Specimens should be centrifuged in a refrigerated centrifuge and the supernatant aliquoted off and frozen immediately. (Minimum: 0.5 mL fine needle aspiration)

Pediatric Collection:
BD Vacutainer serum tube

Storage/Transport Temperature:
Frozen (-20°C)

Performed:
Monday - Friday

Stability:
After centrifugation: Frozen (-20°C): 2 months

Specimen:
Fine Needle Aspiration

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Accurate tumor localization is the key to successful re-operative parathyroid surgery. Ultrasound-guided FNA is one such approach used in patients with persistent hyperparathyroidism requiring re-operative neck surgery, or in patients with unusual appearing or ectopic parathyroid tissue.

Synonyms:

- LAB3143, HFNA, FNA, FNA PTH, FNA, THG, FNH
- LAB3143-VML
- LAB3143VML

Performed:
Monday - Friday

Turn Around Time:
3 days

Methodology:
Varies by test. (Chemiluminescent Immunoassay for thyroglobulin and electrochemiluminescence immunoassay (ECLIA) for PTH)

Components:
THG, FNA Saline Control Specimen Source PTH, FNA

RESULTS INTERPRETATION

Reference Interval:
Not established for this test.

Interpretive Data:
"Negative" in saline control sample means there is no thyroglobulin and/or parathyroid hormone contamination. This test was developed and its performance characteristics determined by Vanderbilt Medical Laboratories. The U.S. Food and Drug Administration has not approved or cleared this test; however, FDA clearance or approval is not currently required for clinical use. The results are not intended to be used as the sole means for clinical diagnosis or patient management decisions.

Methodology:
Varies by test. (Chemiluminescent Immunoassay for thyroglobulin and electrochemiluminescence immunoassay (ECLIA) for PTH)

Human Herpesvirus 6 (HHV-6A and HHV-6B) by Quantitative PCR

LAB3864

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), serum separator tube, or CSF.

Synonyms:

- HHV-6 quantitative
- HHV-6A
- HHV-6B
- HHV6 Quant PCR
- Viral load monitoring
- herpes
- Human herpesvirus 6
- Roseola
- LAB3864-VML
- LAB3864VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), serum separator tube, or CSF.

Specimen Preparation:
Separate serum or plasma from cells. Transfer 1 mL serum, plasma or CSF to a sterile container. (Min: 0.5 mL)

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 5 days; Frozen: 3 months

Performed:
Tue-Sat

Remarks:
Specimen source required.

ORDERING

Synonyms:

- HHV-6 quantitative
- HHV-6A
- HHV-6B
- HHV6 Quant PCR
- Viral load monitoring
- herpes
- Human herpesvirus 6
- Roseola
- LAB3864-VML
- LAB3864VML

Ordering Recommendations:
Detect and quantify HHV6 subtypes A and B in immunocompromised patients.

Performed:
Tue-Sat

Methodology:
Quantitative Polymerase Chain Reaction

Reported:
1-4 days

Notes:
The limit of quantification for this DNA assay is 3.0 log copies/mL (1,000 copies/mL). If the assay DID NOT DETECT the virus, the test result will be reported as "<3.0 log copies/mL (<1,000 copies/mL)." If the assay DETECTED the presence of the virus but was not able to accurately quantify the number of copies, the test result will be reported as "Not Quantified."

This assay detects and quantifies HHV6 subtypes A and B.

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
The quantitative range of this assay is 3.0-6.0 log copies/mL (1,000-999,000 copies/mL).

A negative result (less than 3.0 log copies/mL or less than 1,000 copies/mL) does not rule out the presence of PCR inhibitors in the patient specimen or HHV6 DNA in concentrations below the level of detection of the assay. Inhibition may also lead to underestimation of viral quantitation.

Caution should be taken when interpreting results generated by different assay methodologies.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Tue-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-4 days

Ordering Recommendations:
Detect and quantify HHV6 subtypes A and B in immunocompromised patients.

Interpretive Data:
The quantitative range of this assay is 3.0-6.0 log copies/mL (1,000-999,000 copies/mL).

A negative result (less than 3.0 log copies/mL or less than 1,000 copies/mL) does not rule out the presence of PCR inhibitors in the patient specimen or HHV6 DNA in concentrations below the level of detection of the assay. Inhibition may also lead to underestimation of viral quantitation.

Caution should be taken when interpreting results generated by different assay methodologies.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Reference Interval:
Not detected

Methodology:
Quantitative Polymerase Chain Reaction

Section:
RF-ARUP

CPT Codes:
87533

Remarks:
Specimen source required.

Notes:
The limit of quantification for this DNA assay is 3.0 log copies/mL (1,000 copies/mL). If the assay DID NOT DETECT the virus, the test result will be reported as "<3.0 log copies/mL (<1,000 copies/mL)." If the assay DETECTED the presence of the virus but was not able to accurately quantify the number of copies, the test result will be reported as "Not Quantified."

This assay detects and quantifies HHV6 subtypes A and B.

Human Herpesvirus 8 (HHV-8) by Quantitative PCR

LAB6072

ORDERING INFO

Collect:
Lavender (EDTA), Pink (K_2 EDTA), or Serum Separator Tube (SST).

Synonyms:

- HHV8
- Viral load monitoring, Kaposi's sarcoma herpes virus (KSHV)
- LAB6072-VML
- LAB6072VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), Pink (K_2 EDTA), or Serum Separator Tube (SST).

Specimen Preparation:
Separate serum or plasma from cells. Transport 1 mL plasma, serum, or whole blood in a sterile container. (Min: 0.5 mL)

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 1 week; Frozen: 1 year

Performed:
Mon, Thu

Remarks:
Specimen source required.

ORDERING

Synonyms:

- HHV8
- Viral load monitoring, Kaposi's sarcoma herpes virus (KSHV)
- LAB6072-VML
- LAB6072VML

Ordering Recommendations:
Detect and quantify herpesvirus 8 (HHV-8).

Performed:
Mon, Thu

Methodology:
Quantitative Polymerase Chain Reaction

Reported:
2-5 days

Notes:
The limit of quantification for this DNA test is 3.8 log copies/mL (6,670 copies/mL). If the test DID NOT DETECT the virus, the test result will be reported as "< 3.8 log copies/mL (< 6,670 copies/mL)." If the test DETECTED the presence of the virus but was not able to accurately quantify the number of copies, the test result will be reported as "Not Quantified."

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:

The quantitative range of this assay is 3.8-8.8 log copies/mL (6,670 - 667,000,000 copies/mL).

A negative result (less than 3.8 log copies/mL or less than 6,670 copies/mL) does not rule out the presence of PCR inhibitors in the patient specimen or HHV8 DNA concentrations below the level of detection of the test. Inhibition may also lead to underestimation of viral quantitation.

No international standard is currently available for calibration of this assay. Caution should be taken when interpreting results generated by different assay methodologies.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Human Immunodeficiency Virus (HIV) p24 Antigen and HIV-1/2 Antibody with Reflex Differentiation, serum or plasma

LAB159

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB159, HIV, HIV Ag/Ab Combo
- LAB159-VML
- LAB159VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Ambient (15-25°C): 3 days; Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light blue tube (Sodium citrate) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is intended to be used as an aid in diagnosing HIV-1 and/or HIV-2 infection in patients more than 2 years old.

Synonyms:

- LAB159, HIV, HIV Ag/Ab Combo
- LAB159-VML
- LAB159VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Chemiluminescent Immunoassay

Components:
HIV Ag/Ab

RESULTS INTERPRETATION

Reference Interval:
Nonreactive

Interpretive Data:
A repeatedly reactive result indicates the presence of antibody to HIV-1 or HIV-2, and/or the presence of HIV-1 p24 antigen. A nonreactive result does not rule out infection with HIV.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light blue tube (Sodium citrate) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

Additional Information:
HIV-1 p24 antigen and antibodies to HIV-1&2 are detected simultaneously in this assay. This assay does not distinguish positive signals generated from viral antigen and antibody. Repeatedly reactive specimens are confirmed by HIV-1/HIV-2 differentiation assay. The performance of this assay has not been established for individuals younger than 2 years old.

Components:
HIV Ag/Ab

Resulting Laboratory:
Vanderbilt Medical Laboratories

Human Immunodeficiency Virus (HIV-1) RNA by Quantitative PCR

LAB919

ORDERING INFO

Collect:

Plasma Preparation Tube (PPT) [EDTA]

Synonyms:

- LAB919, HNA, HIV RNA quant, HIV viral load, HIV 1 ultra quant
- LAB919-VML
- LAB919VML

Turn Around Time:

72 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Plasma Preparation Tube (PPT) [EDTA]

Specimen Preparation:

PPT tube must be centrifuged and plasma removed within 24 hours of collection. (Min 0.8mL Plasma)

Pediatric Collection:

Lavender microtainer (EDTA)

Storage/Transport Temperature:

Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Blood: Up to 24 hours at Ambient (15-25°C), 6 days Refrigerated (2-8°C) once spun and plasma/serum separated.

Specimen:

Plasma (PPT)

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

HIV is the etiologic agent of acquired immunodeficiency syndrome (AIDS). Quantitative measurements of HIV viremia in the peripheral blood have shown that higher virus levels may be correlated with increased risk of clinical progression of HIV disease, and that reductions in plasma virus levels may be associated with decreased risk of clinical progression. HIV viral load and drug treatment response are closely linked. With successful drug therapy the viral load decreases and with failure the load increases.

Synonyms:

Human Immunodeficiency Virus 1 (HIV-1) by Qualitative NAAT

LAB6282

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), yellow (ACD), or plasma preparation tube (PPT).

Synonyms:

- HIV1 detection
- HIV 1 RNA
- HIV Qualitative
- Nucleic Acid Amplification Test (NAAT)
- LAB6282-VML
- LAB6282VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), yellow (ACD), or plasma preparation tube (PPT).

Specimen Preparation:
Separate from cells within 24 hours of collection. Transfer 2 mL plasma to an ARUP standard transport tube and freeze. (Min: 0.8 mL)

Unacceptable Conditions:
Heparinized specimens.

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours (Critical: Ship FROZEN); Refrigerated: 72 hours; Frozen: 90 days

Performed:
Sun-Sat

ORDERING

Synonyms:

- HIV1 detection
- HIV 1 RNA
- HIV Qualitative
- Nucleic Acid Amplification Test (NAAT)
- LAB6282-VML
- LAB6282VML

Ordering Recommendations:
Use to detect HIV-1 RNA qualitatively. For quantitative detection, refer to Human Immunodeficiency Virus 1 (HIV-1) by Quantitative NAAT, Plasma (3000867).

Performed:
Sun-Sat

Methodology:
Qualitative Transcription-Mediated Amplification (TMA)

Reported:
1-4 days

Notes:
Assay detects HIV-1 virus RNA. Proviral DNA will not be detected.

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This test detects human immunodeficiency virus type 1 (HIV-1) RNA from Group M, N and O subtypes; it does not detect HIV-1 proviral DNA. A result of "Not Detected" does not rule out HIV-1 RNA concentrations below the limit of detection of the assay or the presence of inhibitors in the patient specimen. The diagnosis of HIV-1 infection should not be made based solely on a single HIV-1 test result. Diagnosis requires repeat and confirmatory testing as recommended by U.S. Health and Human Services guidelines. Improper specimen handling can cause false negatives or contamination.

This assay should not be used for blood donor screening, associated reentry protocols, or for screening human cell, tissues and cellular tissue-based products (HCT/P).

Methodology:
Qualitative Transcription-Mediated Amplification (TMA)

Plasma (EDTA)

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

Therapeutic failure for HIV infection has been closely linked with resistance to antiretroviral drugs. Mutations in the HIV-1 reverse transcriptase (RT) and protease targeted by antiretrovirals can confer drug resistance. Genotypic testing detects resistance-associated mutations in the RT- and protease-encoding genes. Resistance testing is recommended for (1) patients with acute HIV infection, (2) antiretroviral therapy (ART)-naive patients entering HIV care, (3) patients with virologic failure of ART, (4) patients with suboptimal suppression of viral load, and (5) HIV-positive pregnant women. (See Guidelines for the Use of Antiretoviral Agents in HIV-1-Infected Adults, Dept. of Health and Human Services, Oct. 14, 2011).

27-38 days

Ordering Recommendations:
Intended for use in patients with viral loads >=1,000 copies/mL. HIV-1 phenotyping test to determine the tropism (ie, CCR5 or CXCR4) of the virus in patients being considered for CCR5 antagonist therapy.

Methodology:
Polymerase Chain Reaction/Culture

Section:
RF-ARUP

CPT Codes:
87999

Notes:
Procedure should be used for patients with documented HIV-1 infection and viral loads greater than 1000 copies/mL.

Human Leukocyte Antigen (ABC) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded tissue

CoPath134

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- HLA

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Human Papillomavirus (HPV) High Risk by in situ Hybridization, Paraffin

LAB6075

ORDERING INFO

Collect:
Tissue.

Synonyms:

- HPV High Risk ISH
- HPV HR ISH
- HPVHI ISH
- HR-HPV ISH
- HPV
- high-risk HPV ISH
- LAB6075-VML
- LAB6075VML

SPECIMEN REQUIREMENTS

Collect:
Tissue.

Specimen Preparation:
Formalin fix (10 percent neutral buffered formalin) and paraffin-embed tissue. Transport tissue block or 5 unstained 5-micron slides in a tissue transport kit (recommended but not required) (ARUP supply #47808). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 4 slides) Protect paraffin block and/or slides from excessive heat.

Unacceptable Conditions:
Paraffin block with no tumor tissue remaining. Specimens fixed in any fixative other than 10 percent neutral buffered formalin. Decalcified specimens.

Storage/Transport Temperature:
Room temperature or refrigerated. Ship in cooled container during summer months.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Performed:
Mon-Fri

Remarks:
Include surgical pathology report.
If multiple specimens (blocks or slides) are sent to ARUP, they must be accompanied by one of the following: an order comment indicating that the ARUP pathologist should choose the specimen most appropriate for testing (e.g., "Choose best block"), or individual orders for each sample submitted. A Pathologist Block Selection Fee (ARUP test code 3002076) will be added to orders that utilize the first option. If multiple specimens are sent to ARUP without a request for pathologist block/slide selection or individual orders, they will be held until clarification is provided.

ORDERING

- HPV High Risk ISH
- HPV HR ISH
- HPVHI ISH
- HR-HPV ISH
- HPV
- high-risk HPV ISH
- LAB6075-VML
- LAB6075VML

Ordering Recommendations:
Preferred in situ hybridization test to detect high-risk HPV subtypes to determine potential cancer risk.

Performed:
Mon-Fri

Methodology:
In situ Hybridization (ISH)

Reported:
2-5 days

RESULTS INTERPRETATION

Interpretive Data:
Refer to report.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
In situ Hybridization (ISH)

Human T-Lymphotropic Virus (HTLV) Types I/II Antibodies by ELISA with Reflex to HTLV-I/II Confirmation by Western Blot

LAB1239

ORDERING INFO

Collect:
Serum Separator Tube (SST). Also acceptable: Light Blue (Sodium Citrate), Green (Sodium or Lithium Heparin) or Lavender (EDTA).

Synonyms:

- HTLV 1, 2 western blot confirmation
- HTLV 1/2
- HTLV Types 1 & 2 confirmation
- LAB1239-VML
- LAB1239VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST). Also acceptable: Light Blue (Sodium Citrate), Green (Sodium or Lithium Heparin) or Lavender (EDTA).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens containing particulate material.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: Indefinitely (avoid repeated freeze/thaw cycles)

Performed:
Sun-Mon, Wed-Sat

ORDERING

Synonyms:

- HTLV 1, 2 western blot confirmation
- HTLV 1/2
- HTLV Types 1 & 2 confirmation
- LAB1239-VML
- LAB1239VML

Performed:
Sun-Mon, Wed-Sat

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay/Qualitative Western Blot

Reported:
1-3 days

Notes:
If HTLV I/II screen is repeatedly reactive, then HTLV I/II Confirmation by Western Blot will be added. Additional charges apply.

*Performed and Reported times indicated are for screening of the anti-HTLV. Refer to Human T-Lymphotropic Virus Types I/II Antibodies, Western Blot (0020642) for additional information regarding Performed and Reported times.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
HTLV I/II Antibodies by ELISA	Negative

Interpretive Data:
This assay should not be used for blood donor screening, associated re-entry protocols, or for screening Human Cell, Tissues and Cellular and Tissue-Based Products (HCT/P).

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay/Qualitative Western Blot

ADDITIONAL INFORMATION

CPT Codes:
86790; if reflexed, add 86689

Huntington Disease (HD) CAG Repeat Expansion Analysis, Whole Blood

LAB3034

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3034, HD, HUN, HTT, Huntington Disease
- LAB3034-VML
- LAB3034VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient (15-25°C) or Refrigerated (2-8°C)

Performed:

Once per week - variable days

Stability:

Lavender EDTA: Ambient (15-25°C): 2 days; Refrigerated (2-8°C)C: 7 days

Specimen:

Whole Blood

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Clinical evidence of Huntington's disease or carrier screening with positive family history. *NOTE: Confirmation of genetic counseling is required prior to test initiation.

Synonyms:

- LAB3034, HD, HUN, HTT, Huntington Disease
- LAB3034-VML
- LAB3034VML

Performed:

Once per week - variable days

Turn Around Time:

10 days

Methodology:
Direct detection of CAG expansion alleles of the HTT gene by fluorescent PCR with fragment size analysis by capillary electrophoresis; Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Normal: <=26 CAG repeats. Mutable/Intermediate: 27-35 CAG repeats. Reduced Penetrance: 36-39 CAG repeats. Abnormal: >=40 CAG repeats

Interpretive Data:
To identify normal, mutable/intermediate, reduced penetrance, or Huntington's disease alleles of the HTT gene.

Methodology:
Direct detection of CAG expansion alleles of the HTT gene by fluorescent PCR with fragment size analysis by capillary electrophoresis; Laboratory Developed Test

Hyaluronic Acid, Serum

LAB3762

ORDERING INFO

Collect:
Serum separator tube. Also acceptable: Green (sodium or lithium heparin), lavender (EDTA), or pink (K_2EDTA).

Synonyms:

- HA
- Hyaluronate
- LAB3762-VML
- LAB3762VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Also acceptable: Green (sodium or lithium heparin), lavender (EDTA), or pink (K_2EDTA).

Specimen Preparation:
Allow serum specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 2 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Tue

ORDERING

Synonyms:

- HA
- Hyaluronate
- LAB3762-VML
- LAB3762VML

Ordering Recommendations:
Noninvasive assessment of liver status.

Performed:
Tue

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-9 days

RESULTS INTERPRETATION

Reference Interval:
0-54 ng/mL

Interpretive Data:
This test is performed using the Corgenix Hyaluronic Acid test kit. Results obtained with different assay methods or kits cannot be used interchangeably.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Identified Known Familial Variant NGS Testing, Blood Saliva DNA

LAB6319

ORDERING INFO

Collect:

Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Synonyms:

- LAB6319, Known Mutation Testing, Single Variant Testing, Single Mutation Testing, Familial Mutation Testing, Familial Variant Testing
- LAB6319-VML
- LAB6319VML

Turn Around Time:

60 Business Days From Financial Clearance

SPECIMEN REQUIREMENTS

Patient Preparation:

Saliva: Patient Must Follow Kit Instructions

Collect:

Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Specimen Preparation:

Extracted DNA should be sent in a screw cap tube with at least 2 micrograms - 5 micrograms of purified DNA at a concentration of at least 20 ng/ul - 50 ng/uL. Indicate patient's name, date of birth, and concentration on tube label. (Minimum Volume: 2 micrograms for limited specimens)

Pediatric Collection:

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Synonyms:

- N/A

Performed:
Monday-Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
2 Days

Ordering Indicators:
N/A

Interpretive Data:
N/A

Reference Interval:
N/A

Additional Information:
Complete VPLS Test Requisition. Request special requisition form No 60-002-664 if ordering on a regular basis. Package slides in durable slide holder and place with any block in padded envelope to protect from breaking.

Methodology:
Immunohistochemical Stain

Imipramine and Desipramine, Serum or Plasma (Test on Referral as of 03/05/24)

LAB684

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Synonyms:

- Deprimin
- Antideprin
- Deprenyl
- Eupramin
- Imipramil
- Imipramine/Desipramine Fractionation
- Impril
- Irmin
- Janimine
- Melepramin
- Novo-Parmine
- Deprinol
- Desipramine/Imipramine
- Norpramin
- Imipramine and Metabolite
- Presamine
- Surplix
- TCA
- Tofranil
- Tricyclic Antidepressants
- LAB684-VML
- LAB684VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Predose (trough) draw at steady-state concentration.

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 5 days; Refrigerated: 2 weeks; Frozen: 6 months

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Deprimin
- Antideprin
- Deprenyl
- Eupramin
- Imipramil
- Imipramine/Desipramine Fractionation
- Impril
- Irmin
- Janimine
- Melepramin
- Novo-Parmine
- Deprinol
- Desipramine/Imipramine
- Norpramin
- Imipramine and Metabolite
- Presamine
- Surplix
- TCA
- Tofranil
- Tricyclic Antidepressants
- LAB684-VML
- LAB684VML

Ordering Recommendations:
Use to optimize dosing and monitor patient adherence.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

Notes:
Report includes individual values for imipramine, desipramine, and total.

RESULTS INTERPRETATION

Reference Interval:
Effective February 19, 2013

Therapeutic Range	Total (imipramine and desipramine): 150-300 ng/mL
Toxic Level	Greater than 500 ng/mL

Interpretive Data:
Toxic concentrations may cause anticholinergic effects, drowsiness, and cardiac abnormalities.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Immature Platelet Fraction(%)

LAB5780

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- IPF, Reticulated Platelet Count, Immature platelet fraction
- LAB5780-VML
- LAB5780VML

Turn Around Time:
Stat: 1 hour; Routine: 4 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Draw to fill line, mix well with anticougulant

Pediatric Collection:
Pediatric: 0.25mL EDTA 2K whole blood minimum

Storage/Transport Temperature:
Room temperature or refrigerated

Performed:
Daily

Stability:
15° to 25°C: 8 hrs; 2-8C: 24 hrs

Specimen:
Blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test measures the percent of immature platelets in the peripheral blood

Synonyms:

- IPF, Reticulated Platelet Count, Immature platelet fraction
- LAB5780-VML
- LAB5780VML

Performed:
Daily

Turn Around Time:
Stat: 1 hour; Routine: 4 hours

Methodology:
Uses stain specifically for platelets, the higher the flourescence and larger size helps differentiate immaturity.

Components:
IPF

RESULTS INTERPRETATION

Reference Interval:
1.6-8.1

Interpretive Data:
For Platelets less than 10,000/microliter, The percent of immature platelets is not accurate.

Methodology:
Uses stain specifically for platelets, the higher the flourescence and larger size helps differentiate immaturity.

ADDITIONAL INFORMATION

Immunofixation with Free Light Chains, Quantitative, Urine

LAB6091

ORDERING INFO

Collect:
24-hour urine. Refrigerate during collection. Also acceptable: Random urine specimens and urine supernate.

Synonyms:

- Monoclonal protein detection and quantitation, urine
- Free Urinary Kappa/Lambda Ratio
- Free Urinary Lambda Light Chain
- IFE
- IFE urine
- Free Urinary Kappa Light Chains
- Immunofixation Electrophoresis, urine
- Urinary Light Chains
- LAB6091-VML
- LAB6091VML

SPECIMEN REQUIREMENTS

Collect:
24-hour urine. Refrigerate during collection. Also acceptable: Random urine specimens and urine supernate.

Specimen Preparation:
Transfer two 4 mL aliquots from a well-mixed 24-hour collection to individual ARUP Standard Transport Tubes. (Min: 4 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 3 weeks; Frozen: 6 months

Performed:
Sun-Sat

Remarks:
Record total volume and collection time interval on transport tube and test request form.

ORDERING

Synonyms:

- Monoclonal protein detection and quantitation, urine
- Free Urinary Kappa/Lambda Ratio
- Free Urinary Lambda Light Chain
- IFE
- IFE urine
- Free Urinary Kappa Light Chains
- Immunofixation Electrophoresis, urine
- Urinary Light Chains
- LAB6091-VML
- LAB6091VML

Ordering Recommendations:
Aid in the monitoring of patients with urinary monoclonal proteins (Bence Jones protein).

Performed:
Sun-Sat

Methodology:
Qualitative Immunofixation Electrophoresis/Quantitative Immunoturbidimetry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Total Protein	Less than 150 mg/d
Free Urinary Kappa Light Chains	0.00 - 32.90 mg/L
Free Urinary Kappa Excretion/Day	Refer to Report
Free Urinary Lambda Light Chain	0.00 - 3.79 mg/L
Free Urinary Lambda Excretion/Day	Refer to Report
IFE Interpretation	By report

Interpretive Data:

Results of urine free light chain testing can be used to monitor disease progression or response to therapy in patients for whom urine electrophoresis is unable to provide reliable Bence Jones Protein quantification. The results of urine kappa and lambda free light chain quantitative values may be misleading in specimens with high levels of urinary polyclonal free light chains, and absent Bence Jones protein by immunofixation; therefore correlation with urine immunofixation is required to identify inconsistent results.

Total urinary protein is determined turbidimetrically by adding the albumin and kappa and/or lambda light chains. This value may not agree with the total protein as determined by chemical methods, which characteristically underestimates urinary light chains.

Undetected antigen excess is a rare event but cannot be excluded. Free light chain results should always be interpreted in conjunction with other clinical and laboratory findings.

Methodology:

Qualitative Immunofixation Electrophoresis/Quantitative Immunoturbidimetry

Immunofixation, Random and 24 hour Urine

LAB438

ORDERING INFO

Collect:

Routine urine container - 20 mL

or 24 hour collection

Synonyms:

- LAB438, UPEP, UPE, U-PEP, Urine Protein Electrophoresis
- LAB438-VML
- LAB438VML

Turn Around Time:

5 days

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Routine urine container - 20 mL

or 24 hour collection

Specimen Preparation:

Proper collection of both spot/ random urine should be filled to at least 1/2 of the collection cup. 24 urine collections should include the total sample collected over 24 hours, 20ml minimum volume for either urine specimen.

Pediatric Collection:

N/A

Storage/Transport Temperature:

Refrigerated (2-8°C)

Performed:

Monday - Friday

Stability:

Refrigerated (2-8°C): 72 hours

Specimen:

Urine (24 hour collection preferred, spot /random samples acceptable) with no additives

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Urine protein electrophoresis is primarily useful for the detection of gammopathies, including those associated with lymphoproliferative neoplasms. Immunofixation, included in the testing, can identify the heavy and light chain involved in monoclonal bands that may be detected. In assessment of a new patient, correlation with serum protein electrophoresis may be indicated

Synonyms:

- LAB438, UPEP, UPE, U-PEP, Urine Protein Electrophoresis
- LAB438-VML
- LAB438VML

Performed:

Monday - Friday

Turn Around Time:

5 days

Methodology:

Protein Gel Electrophoresis and Immunofixation

Components:
Total % and quantitative Immunoglobulin proteins including M-spike if present, presence or absence of a monoclonal light chain

RESULTS INTERPRETATION

Reference Interval:
No monoclonal antibody detected

Interpretive Data:
N/A

Methodology:
Protein Gel Electrophoresis and Immunofixation

ADDITIONAL INFORMATION

Section:
Hematopathology/ Flow Cytometry

Alternate Specimen:
N/A

Additional Information:
Total urine protein is included in this order. Additionally, If electrophoresis densitometric scan and immunofixation of monoclonal protein is detected, follow-up identification will be performed.

Immunoglobulin A, Plasma or Serum

LAB73

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- IGA, Immunoglobulin A, LAB73
- LAB73-VML
- LAB73VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 8 months; 2° to 8°C: 8 months; Frozen: 8 months

Specimen:
Plasma or Serum

Alternate Specimen:
Gold (Clot Activator with Gel)

ORDERING

Immunoglobulin D, Serum

LAB3767

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- IgD
- IgD Total
- Immunoglobulin D
- LAB3767-VML
- LAB3767VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 14 days; Frozen: 6 months

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- IgD
- IgD Total
- Immunoglobulin D
- LAB3767-VML
- LAB3767VML

Ordering Recommendations:
Aids in diagnosis or monitoring of IgD monoclonal gammopathies and IgD-related immune deficiencies.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Immunoturbidimetry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 15.3 mg/dL

Interpretive Data:
IgD is one of the five classes of immunoglobulin. IgD is mainly found on the surface of B-cells and may help regulate B-cell function. IgD likely serves as an early B-cell antigen receptor, however, the function of the circulating IgD is largely unknown.

Methodology:
Quantitative Immunoturbidimetry

Immunoglobulin E, plasma

LAB74

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- LAB74, IGE
- LAB74-VML
- LAB74VML

Turn Around Time:
3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Specimens should be centrifuged immediately and the separated serum frozen. (Minimum: 0.5 mL serum)

Pediatric Collection:
Light green microtainer (Lithium heparin with gel)

Storage/Transport Temperature:
Frozen (-20°C)

Performed:
Monday - Friday

Stability:
After separation from cells: Refrigerated (2-8°C): 3 days Frozen (-20°C): 6 months

Specimen:
Plasma

Alternate Specimen:
Red tube (no gel)

ORDERING

Ordering Indicators:
This test is used to aid in the clinical diagnosis, evaluation, and management of suspected allergic reactions.

Synonyms:

- LAB74, IGE
- LAB74-VML
- LAB74VML

Performed:
Monday - Friday

Turn Around Time:
3 days

Methodology:
Chemiluminescent Immunoassay

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
< 1 year: =/< 30 IU/mL 1 - 9 years: =/< 50 IU/mL =/> 10 years: =/< 100 IU/mL

Interpretive Data:
The appearance of elevated concentrations of IgE is not allergy-specific, and may be encountered not only in sensitized individuals, but also in cases of IgE myeloma, pulmonary aspergillosis, and during the active stage of parasitic infestations.

Methodology:
Chemiluminescent Immunoassay

Ordering Recommendations:
Aid as second order test for evaluation of patients suspected of humoral immunodeficiency or combined immunodeficiency (humoral or cellular).

Performed:
Sun-Sat

Methodology:
Quantitative Immunoturbidimetry

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Immunoglobulin G Subclass 1	**Age** / **Reference Interval (mg/dL)** 0-2 years: 167-900 3-4 years: 313-941 5-9 years: 363-1276 10-14 years: 316-1076 15-18 years: 325-894 19 years and older: 240-1118
Immunoglobulin G Subclass 2	**Age** / **Reference Interval (mg/dL)** 0-2 years: 55-359 3-4 years: 72-287 5-9 years: 27-398 10-14 years: 86-509 15-18 years: 156-625 19 years and older: 124-549
Immunoglobulin G Subclass 3	**Age** / **Reference Interval (mg/dL)** 0-2 years: 34-85 3-4 years: 25-117 5-9 years: 17-169 10-14 years: 14-201 15-18 years: 34-246 19 years and older: 21-134
Immunoglobulin G Subclass 4	**Age** / **Reference Interval (mg/dL)** 0-2 years: 1-34 3-4 years: 1-65 5-9 years: 0-168 10-14 years: 1-103 15-18 years: 2-170 19 years and older: 1-123

Interpretive Data:

The total IgG (mg/dL) can be derived from the sum of the subclass IgG1, IgG2, IgG3, and IgG4 values. However, a confirmatory and more precise total IgG is available by the immunoturbidimetric method of quantitation for total IgG. Refer to test Immunoglobulin G, Serum (0050350).

Ordering Recommendations:
Aids in the diagnosis and monitoring of patients with multiple sclerosis and other inflammatory disease of the nervous system.

Interpretive Data:
Access complete set of age- and/or gender-specific reference intervals for this test in the ARUP Laboratory Test Directory (https://ltd.aruplab.com).

To ensure accurate result interpretation, it is recommended that both CSF and serum specimens be collected on the same day. If specimens are not collected within this specified timeframe, it is advised to exercise caution when interpreting the results.

Reference Interval:

Components	Reference Interval
Albumin, CSF	0-35 mg/dL
Immunoglobulin G	<table><tr><th>Age</th><th>Reference Interval (mg/dL)</th></tr><tr><td>0-2 years</td><td>242-1108</td></tr><tr><td>3-4 years</td><td>485-1160</td></tr><tr><td>5-9 years</td><td>514-1672</td></tr><tr><td>10-14 years</td><td>581-1652</td></tr><tr><td>15-18 years</td><td>479-1433</td></tr><tr><td>19 years and older</td><td>768-1632</td></tr></table>
Immunoglobulin G CSF	0.0-6.0 mg/dL
Albumin, Serum	3500-5200 mg/dL
Albumin Index	0.0-9.0
CSF IgG Synthesis Rate	Less than or equal to 8.0 mg/d
CSF IgG/Albumin Ratio	0.09-0.25
IgG Index	0.28-0.66

Immunoglobulin G, Plasma or Serum

LAB71

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- IGG, Immunoglobulin G, LAB71
- LAB71-VML
- LAB71VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 4 months; 2° to 8°C: 8 months; Frozen: 8 months

Specimen:
Plasma or Serum

Alternate Specimen:
Gold (Clot Activator with Gel)

Immunoglobulin G/Albumin Ratio, CSF

LAB6389

ORDERING INFO

Collect:
CSF.

Synonyms:

- Albumin Ratio
- IgG/Albumin Ratio, CSF
- IgG/Albumin Ratio
- Specific Protein (CSF)
- LAB6389-VML
- LAB6389VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Centrifuge and separate to remove cellular material. Transfer 1 mL CSF to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Grossly bloody or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 month; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Albumin Ratio

Immunoglobulin G4 by Immunohistochemistry

LAB3180

ORDERING INFO

Collect:
Tissue or cells.

Synonyms:

- IgG4 antibody immunostaining
- IgG4 IHC
- LAB3180-VML
- LAB3180VML

SPECIMEN REQUIREMENTS

Collect:
Tissue or cells.

Specimen Preparation:
Formalin fix (10 percent neutral buffered formalin) and paraffin embed specimen (cells must be prepared into a cellblock). Protect paraffin block and/or slides from excessive heat. Transport tissue block or 5 unstained (3-5 micron thick sections), positively charged slides in a tissue transport kit (ARUP supply #47808). Available online through eSupply using ARUP Connect (TM) or contact ARUP Client Services at (800) 522-2787. (Min: 2 slides). If sending precut slides, do not oven bake.

Unacceptable Conditions:
Specimens submitted with non-representative tissue type. Depleted specimens.

Storage/Transport Temperature:
Room temperature or refrigerated. Ship in cooled container during summer months.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Performed:
Mon-Fri

Remarks:
IMMUNOHISTOCHEMISTRY ORDERING AND SUBMISSION DETAILS: Submit electronic request. If you do not have electronic ordering capability, use an ARUP Immunohistochemistry Stain Form (#32978) and include an ARUP client number. For additional technical details, contact ARUP Client Services at (800) 522-2787.

ORDERING

Synonyms:

- IgG4 antibody immunostaining
- IgG4 IHC
- LAB3180-VML
- LAB3180VML

Ordering Recommendations:
Refer to ARUP Immunohistochemistry Stain Offerings brochure at www.aruplab.com/ap/resources.

Immunoglobulin Heavy Chain (IGH) Gene Rearrangement, Whole blood, bone marrow, tissue

LAB3035

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3035, B cell gene rearrangement, B cell clonality, IGR, IGH
- LAB3035-VML
- LAB3035VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. Curls and unstained slides should be cut 10 micron thick with two accompanying H&E stained slides cut before and after unstained slides or curls. Tissue blocks will be returned after testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

Two Lavender microtainers (EDTA) or bone marrow

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Paraffin embedded tissue: Ambient (15-25°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Tuesday or Wednesday

Stability:

EDTA and ACD-A tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Paraffin block: indefinitely; Purified DNA: indefinitely at -70°C

Specimen:

Whole blood, bone marrow, paraffin embedded tissue, or purified DNA

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

PCR testing aids in the diagnosis and monitoring of B-cell lymphoproliferative disorders and is most useful in detecting a clonal population of B cells in situations where 1) there is insufficient histological evidence or lack of clear monotypism on immunophenotypic studies to diagnose a lymphoma, 2) limited amounts of tissue or only archival material from paraffin blocks are available, or 3) the relationship of two disease processes is being evaluated.

Synonyms:

- LAB3035, B cell gene rearrangement, B cell clonality, IGR, IGH
- LAB3035-VML
- LAB3035VML

Performed:
Tuesday or Wednesday

Turn Around Time:
10 days

Methodology:
Fluorescent PCR using the Invivoscribe IGH gene clonality kit with fragment size analysis by capillary electrophoresis. Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
No detection of clonal population

Interpretive Data:
Provides a semi-quantitative assessment of B-cell clonality. Clinical correlation is required.

Methodology:
Fluorescent PCR using the Invivoscribe IGH gene clonality kit with fragment size analysis by capillary electrophoresis. Laboratory Developed Test

Inhibin A (Dimer)

LAB5940

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- dimeric inhibin A
- inhibin-A
- LAB5940-VML
- LAB5940VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting specimens are recommended, but not required.

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Hemolyzed or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- dimeric inhibin A
- inhibin-A
- LAB5940-VML
- LAB5940VML

Ordering Recommendations:
Aid in the diagnosis and monitoring of various hormonal reproductive disorders.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
1-2 days

RESULTS INTERPRETATION

Reference Interval:

Effective November 18, 2013

Age/ Phase	Inhibin A (Dimer) pg/mL
Normal Cycling Females: Early Follicular Phase (-14 to -10) Mid Follicular Phase (-9 to -4) Late Follicular Phase (-3 to -1) Mid Cycle (Day 0) Early Luteal (1 to 3) Mid Luteal (4 to 11) Late Luteal (12 to 14)	Normal Cycling Females: 1.8-17.3 pg/mL 3.5-31.7 pg/mL 9.8-90.3 pg/mL 16.9-91.8 pg/mL 16.1-97.5 pg/mL 3.9-87.7 pg/mL 2.7-47.1 pg/mL
IVF-Peak Levels PCOS-Ovulatory Postmenopausal	354.2-1690.0 pg/mL 5.7-16.0 pg/mL less than 6.9 pg/mL
Normal males	less than 2.1 pg/mL

Interpretive Data:

This assay is performed using the Beckman Coulter Unicel DxI assay. Values may be elevated during normal pregnancy. Preeclampsia, Down Syndrome, and some cancers may increase Inhibin-A values.

Methodology:

Quantitative Chemiluminescent Immunoassay

Inhibin B

LAB3769

ORDERING INFO

Collect:
Serum separator tube or plain red.

Synonyms:

- LAB3769-VML
- LAB3769VML

SPECIMEN REQUIREMENTS

Patient Preparation:
For premenopausal females, collection is preferred during the follicular phase of the menstrual cycle.

Collect:
Serum separator tube or plain red.

Specimen Preparation:
Transport 0.5 mL serum. (Min: 0.2 mL)

Unacceptable Conditions:
Room temperature specimens. Grossly hemolyzed specimens. Plasma

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 72 hours; Frozen: 1 month

Performed:
Wed, Fri

ORDERING

Synonyms:

- LAB3769-VML
- LAB3769VML

Ordering Recommendations:
Use to differentiate ovarian tumor with normal CA 125 as stromal or mucinous epithelial tumor. May be used for monitoring recurrence of stromal ovarian tumors.

Performed:
Wed, Fri

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Male	Female
<15 days: 68-373 pg/mL 15 days-6 months: 42-516 pg/mL 7 months-7 years: 24-300 pg/mL 8-30 years: 47-383 pg/mL 31-72 years: 10-357 pg/mL	1 day-12 years: <=182 pg/mL 13-41 years (regular cycle, follicular phase): 8-223 pg/mL 42-51 years (regular cycle, follicular phase): <=107 pg/mL 51-76 years (postmenopausal): <=11 pg/mL

Interpretive Data:
This test is performed using the ANSH ultra-sensitive Inhibin B ELISA kit. Values obtained with different methodologies or kits cannot be used interchangeably.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Insulin Antibody

LAB649

ORDERING INFO

Collect:
Serum separator tube or plain red.

Synonyms:

- Insulin Antibodies, Serum
- anti-insulin antibody
- Human Insulin Antibodies
- insulin AB
- LAB649-VML
- LAB649VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plain red.

Specimen Preparation:
Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL)

Unacceptable Conditions:
Plasma. Hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 2 months

Performed:
Tue, Wed, Fri

ORDERING

Synonyms:

- Insulin Antibodies, Serum
- anti-insulin antibody
- Human Insulin Antibodies
- insulin AB
- LAB649-VML
- LAB649VML

Ordering Recommendations:
Determine presence of antibodies to endogenous or exogenous insulin analogues. Testing not recommended for patients receiving insulin >2 weeks, as insulin antibody formation may occur.If pursuing antibody testing to determine autoimmune diabetes mellitus (DM), perform at least two antibody tests. In most cases, use glutamic acid decarboxylase antibody in combination with another antibody test. Other antibody tests include Islet Antigen-2 (IA-2) Autoantibody (3001499), Glutamic Acid Decarboxylase Antibody (2001771), Islet Cell Cytoplasmic Antibody, IgG (0050138), and Zinc Transporter 8 Antibody (2006196). Do not use to differentiate type 1 DM from type 2 DM, for most cases.

Performed:
Tue, Wed, Fri

Methodology:
Semi-Quantitative Radioimmunoassay

Reported:
2-5 days

RESULTS INTERPRETATION

Reference Interval:
Effective May 21, 2012

0.0-0.4 Kronus Units/mL

Interpretive Data:
A value greater than 0.4 Kronus Units/mL is considered positive for Insulin Antibody. Kronus units are arbitrary. Kronus Units = U/mL.

This assay is intended for the semi-quantitative determination of antibodies to endogenous insulin or antibodies to exogenous insulin in human serum. Antibodies to exogenous insulin therapies may be detected using this method. The magnitude of the measured result is not related to disease progression. Results should be interpreted within the context of clinical symptoms.

Methodology:
Semi-Quantitative Radioimmunoassay

Insulin, Serum

LAB527

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- IRI, INS, Insulin Level, LAB527
- LAB527-VML
- LAB527VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting specimen. Non fasting specimens are acceptable for special studies.

Collect:
Red tube (no gel)

Specimen Preparation:
Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.4 mL)

Pediatric Collection:
1 Red Microtainer (No Gel)

Storage/Transport Temperature:
Must be spun in refrigerated centrifuge and separated. Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 2° to 8°C: 3 days; Frozen: 7 days

Specimen:
Serum

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
N/A

Methodology:

Quantitative Chemiluminescent Immunoassay

Section:

RF-ARUP

CPT Codes:

84305

Notes:

Both patient age and sex are required for Z-score calculation. Reference intervals have not been established in individuals older than 85 years.

Insulin-Like Growth Factor 2 (IGF-2)

LAB3770

ORDERING INFO

Collect:
Plain Red or Serum Separator Tube (SST).

Synonyms:

- IGF-2 (Insulin-Like Growth Factor II)
- LAB3770-VML
- LAB3770VML

SPECIMEN REQUIREMENTS

Collect:
Plain Red or Serum Separator Tube (SST).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube (Min: 0.2 mL). Freeze Immediately.

Unacceptable Conditions:
Moderately or grossly hemolyzed or severely lipemic specimens

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 2 days; Frozen: 2 months (Avoid repeated freeze/thaw cycles)

Performed:
Tue

ORDERING

Synonyms:

- IGF-2 (Insulin-Like Growth Factor II)
- LAB3770-VML
- LAB3770VML

Ordering Recommendations:
May be used as an adjunct to IGF-1 in diagnosis of growth disorders.

Performed:
Tue

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Prepubertal (0-11 years old)	127-473 ng/mL
Postpubertal (12 years and older)	180-580 ng/mL

Interpretive Data:
Refer to report.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Insulin-Like Growth Factor Binding Protein 2 (IGFBP-2)

LAB3764

ORDERING INFO

Collect:
Plain red or serum separator tube (SST).

Synonyms:

- IGFBP-2
- LAB3764-VML
- LAB3764VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting specimen preferred.

Collect:
Plain red or serum separator tube (SST).

Specimen Preparation:
Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.2 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Frozen. Also acceptable: Refrigerated.

Stability (from collection to initiation):
Ambient: 12 hours; Refrigerated: 4 days; Frozen: 28 days

Performed:
Varies

ORDERING

Synonyms:

- IGFBP-2
- LAB3764-VML

Insulin-Like Growth Factor Binding Protein-3, serum

LAB526

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB526, IGFBP3, IGFBP-3, BP3
- LAB526-VML
- LAB526VML

Turn Around Time:
3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Red tube (no gel)

Specimen Preparation:
Specimens must be spun in refrigerated centrifuge, separated, and frozen. (Minimum 0.5 mL serum)

Pediatric Collection:
Red microtainer (no gel)

Storage/Transport Temperature:
Frozen (-20°C)

Performed:
Monday - Friday

Stability:
After separation from cells: Ambient (15-25°C): 24 hours Refrigerated (2-8°C): 24 hours Frozen (-20°C): 1 year

Specimen:
Serum

Alternate Specimen:
Light green tube (Lithium heparin with gel)

ORDERING

Ordering Indicators:
This test is used to aid in the clinical diagnosis of growth disorders.

Synonyms:

- LAB526, IGFBP3, IGFBP-3, BP3
- LAB526-VML
- LAB526VML

Performed:
Monday - Friday

Turn Around Time:
3 days

Methodology:
Chemiluminescent Immunoassay

Interleukin 1 beta, Serum

LAB3772

ORDERING INFO

Collect:
Serum separator tube (SST), or plain red.

Synonyms:

- cytokines
- IL-1
- IL-1 Beta
- Interleukin 1-Beta
- IL 1-Beta
- IL1
- IL1B
- Interleukin 1b
- cytokine
- LAB3772-VML
- LAB3772VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST), or plain red.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Unacceptable Conditions:
Refrigerated specimens. Contaminated or heat-inactivated specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered. Ship in an ARUP Standard Transport Tube.

Stability (from collection to initiation):
After separation from cells: Ambient: 30 minutes; Refrigerated: Unacceptable; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- cytokines
- IL-1
- IL-1 Beta
- Interleukin 1-Beta
- IL 1-Beta
- IL1
- IL1B
- Interleukin 1b
- cytokine
- LAB3772-VML
- LAB3772VML

Ordering Recommendations:
Primarily used for research and to support attempts to understand the pathogenesis of immune, infectious, allergic, or inflammatory disorders.

Performed:
Sun-Sat

Methodology:
Quantitative Multiplex Bead Assay

Reported:
1-4 days

Notes:
Cytokine levels may demonstrate diurnal variation. For longitudinal comparison, it is recommended that cytokine levels be determined at the same time of day.

RESULTS INTERPRETATION

Reference Interval:
Effective May 18, 2020
6.7 pg/mL or less

Interpretive Data:
Results are used to understand the pathophysiology of immune, infectious, or inflammatory disorders, or may be used for research purposes.

Methodology:
Quantitative Multiplex Bead Assay

ADDITIONAL INFORMATION

CPT Codes:
83520

Effective May 18, 2020
2.0 pg/mL or less

Interpretive Data:
Results are used to understand the pathophysiology of immune, infectious, or inflammatory disorders, or may be used for research purposes.

Methodology:
Quantitative Multiplex Bead Assay

ADDITIONAL INFORMATION

CPT Codes:
83529

Section:
RF-ARUP

Notes:
Cytokine levels may demonstrate diurnal variation. For longitudinal comparison, it is recommended that cytokine levels be determined at the same time of day.

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:
Serum separator tube, or plain red.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Unacceptable Conditions:
Refrigerated specimens. Contaminated or heat-inactivated specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 30 minutes; Refrigerated: Unacceptable; Frozen: 1 year

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered. Ship in an ARUP Standard Transport Tube.

Synonyms:

- cytokines
- IL-6
- cytokine
- IL6
- Interleukin-6, Serum
- LAB332-VML
- LAB332VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-4 days

Ordering Recommendations:
Primarily used for research and to support attempts to understand the pathogenesis of immune, infectious, allergic, or inflammatory disorders.

Interpretive Data:
Results are used to understand the pathophysiology of immune, infectious, or inflammatory disorders, or may be used for research purposes.

Intrinsic Factor Blocking Antibody

LAB857

ORDERING INFO

Collect:
Serum separator tube or plain red.

Synonyms:

- IFAB
- Anti-Intrinsic Factor
- IF AB Type 1 levels
- IF blocking antibody
- Intrinsic Factor Blocking Antibody, Serum IF blocking Ab
- Type 1 Intrinsic Factor Antibody
- IF Blocking
- LAB857-VML
- LAB857VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plain red.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Unacceptable Conditions:
Grossly hemolyzed or severely lipemic specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 48 hours; Frozen: 1 month

Performed:
Sun-Sat

Iodine, Urine

LAB3237

ORDERING INFO

Collect:
24-hour or random urine collection.

Synonyms:

- I urine
- Iodide urine
- Urinary Free Iodine
- Urinary Iodine
- LAB3237-VML
- LAB3237VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, nonessential over-the-counter medications for 48 hours (upon the advice of their physician). In addition, the administration of iodine-based contrast media and drugs containing Iodine may yield elevated results. Specimen must be collected in a plastic container and should be refrigerated after collection.

Collect:
24-hour or random urine collection.

Specimen Preparation:
Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Tubes (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL)

Unacceptable Conditions:
Acid preserved urine. Specimens collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element-free transport tube (with the exception of the original device).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 2 months; Refrigerated: 2 months; Frozen: 2 months

Performed:
Tue, Thu, Sat

Remarks:
Record the total volume and collection time interval on transport tube and on test request form.

ORDERING

Synonyms:

- I urine
- Iodide urine
- Urinary Free Iodine
- Urinary Iodine
- LAB3237-VML
- LAB3237VML

Ordering Recommendations:
Recommended for the assessment of iodine nutritional status. This test reports total iodine from all iodine-containing species present in the specimen but does not determine the chemical form (species) of the iodine present. For determination of iodine excess and monitoring iodine overload in patients administered iodine-containing medications, refer to Iodine, Serum (2007463).

Performed:
Tue, Thu, Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Creatinine, Urine - per 24h	<table><tr><th>Age</th><th>Male (mg/d)</th><th>Female (mg/d)</th></tr><tr><td>3-8 years</td><td>140-700</td><td>140-700</td></tr><tr><td>9-12 years</td><td>300-1300</td><td>300-1300</td></tr><tr><td>13-17 years</td><td>500-2300</td><td>400-1600</td></tr><tr><td>18-50 years</td><td>1000-2500</td><td>700-1600</td></tr><tr><td>51-80 years</td><td>800-2100</td><td>500-1400</td></tr><tr><td>81 years and older</td><td>600-2000</td><td>400-1300</td></tr></table>
Iodine, Urine - per volume	16 years and older: 26.0-705.0 µg/L
Iodine, Urine - per 24h	16 years and older: 93.0-1125.0 µg/d
Iodine, per gram of CRT	35.0-540.0 µg/g CRT

Interpretive Data:

Values greater than 1000 µg/L may indicate dietary excess, but more frequently suggest recent drug or contrast media exposure.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Iron, Plasma or Serum

LAB94

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- FE, Iron Level, Iron Blood, LAB94
- LAB94-VML
- LAB94VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.3 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 7 days; 2° to 8°C: 3 weeks; Frozen: 1 year

Specimen:
Plasma or Serum

ORDERING

Islet Antigen-2 (IA-2) Autoantibody, Serum

LAB5995

ORDERING INFO

Collect:
Plain Red or Serum Separator Tube (SST).

Synonyms:

- Islet Cell Antigen (ICA) 512
- ICA-512
- Islet Antigen 2
- Islet Cell Antibody
- IA-2 Autoantibody
- Tyrosine Phosphatase-Like Protein Antibodies
- tyrosine phosphatase-related islet antigen 2
- Anti-IA2 Antibody
- IA-2
- IA-2 AB
- LAB5995-VML
- LAB5995VML

SPECIMEN REQUIREMENTS

Collect:
Plain Red or Serum Separator Tube (SST).

Specimen Preparation:
Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.35 mL)

Unacceptable Conditions:
Plasma. Specimens submitted in frozen Serum Separator Tubes (SST). Grossly hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 2 months

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Islet Cell Antigen (ICA) 512
- ICA-512
- Islet Antigen 2
- Islet Cell Antibody
- IA-2 Autoantibody
- Tyrosine Phosphatase-Like Protein Antibodies
- tyrosine phosphatase-related islet antigen 2
- Anti-IA2 Antibody
- IA-2
- IA-2 AB
- LAB5995-VML
- LAB5995VML

Ordering Recommendations:
If pursuing antibody testing to determine autoimmune diabetes mellitus, perform at least two antibody tests. In most cases, use glutamic acid decarboxylase antibody in combination with another antibody test. Other antibody tests include Glutamic Acid Decarboxylase Antibody (2001771), Insulin Antibody (0099228), Islet Cell Cytoplasmic Antibody, IgG (0050138), and Zinc Transporter 8 Antibody (2006196). Most useful to establish autoimmune etiology in previously diagnosed type 1 DM. Do not use to differentiate type 1 DM from type 2 DM, for most cases.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
2-10 days

RESULTS INTERPRETATION

Reference Interval:
0.0-7.4 Units/mL

Interpretive Data:
A value greater than or equal to 7.5 Units/mL is considered positive for IA-2 autoantibody.

This assay is intended for the quantitative determination of autoantibodies to Islet Antigen-2 (IA-2) in human serum. Results should be interpreted within the context of clinical symptoms.

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay

- beta cell
- ICA
- Islet Cell Ab IgG
- LAB3774-VML
- LAB3774VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Unacceptable Conditions:
Plasma. CSF. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Cytoplasmic Islet Cell Ab
- Anti-Islet Cell Antibody
- beta cell
- ICA
- Islet Cell Ab IgG
- LAB3774-VML
- LAB3774VML

Ordering Recommendations:
If pursuing antibody testing to determine autoimmune diabetes mellitus (DM), perform at least two antibody tests. In most cases, use glutamic acid decarboxylase antibody in combination with another antibody test. Other antibody tests include Islet Antigen-2 (IA-2) Autoantibody (3001499), Glutamic Acid Decarboxylase Antibody (2001771), Insulin Antibody (0099228), and Zinc Transporter 8 Antibody (2006196). Most useful to establish autoimmune etiology in previously diagnosed type 1 DM. Do not use to differentiate type 1 DM from type 2 DM, for most cases.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
< 1:4 No antibody detected.

Interpretive Data:
Islet cell antibodies (ICAs) are associated with type 1 diabetes (T1D), an autoimmune endocrine disorder. ICAs may be present years before the onset of clinical symptoms. To calculate Juvenile Diabetes Foundation (JDF) units: multiply the titer x 5 (1:8 8 x 5 = 40 JDF Units).

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Isohemagglutinin Titer, IgG and IgM

LAB3773

ORDERING INFO

Collect:
Lavender (K_2EDTA), or Pink (K_2EDTA).

Synonyms:

- Isohemagglutinin Titer Anti-A
- Isohemagglutinin Titer Anti-B
- Anti-A & B Titer
- LAB3773-VML
- LAB3773VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (K_2EDTA), or Pink (K_2EDTA).

Specimen Preparation:
Do not freeze. Transport 14 mL whole blood. (Min: 6 mL)

Unacceptable Conditions:
Separator or gel tubes.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: Unacceptable

Performed:
Mon-Fri

ORDERING

Synonyms:

- Isohemagglutinin Titer Anti-A
- Isohemagglutinin Titer Anti-B
- Anti-A & B Titer
- LAB3773-VML
- LAB3773VML

Ordering Recommendations:
Aid in determination of the relative amount of anti-A or anti-B present in serum to evaluate an individual's ability to mount an immune response. Most often performed on pediatric patients with recurrent infections.

Performed:
Mon-Fri

Methodology:
Hemagglutination

Reported:
1-3 days

Notes:
Isohemagglutinin titers contain both IgM and IgG. Both IgG and IgM titers will be performed for this test. If only IgM or IgG titer is desired, order Isohemagglutinin Titer, IgG (2000271) or Isohemagglutinin Titer, IgM (2000270). Specimens are screened for antibodies; if positive, an antibody panel will be performed. Titers will be performed as indicated for specific blood groups. Additional charges will apply to antibody identification and titer testing.

RESULTS INTERPRETATION

Reference Interval:
Normals are not applicable.

Methodology:
Hemagglutination

ADDITIONAL INFORMATION

CPT Codes:
86900; if blood type is A add: 86886, 86941; if blood type is B, add: 86886, 86941; if blood type is O, add: 86886 x2, 86941 x2. If blood type is AB, no additional titers will be performed.

Hemagglutination

Section:
RF-ARUP

CPT Codes:
86900; if blood type is A add: 86886, 86941; if blood type is B, add: 86886, 86941; if blood type is O, add: 86886 x2, 86941 x2. If blood type is AB, no additional titers will be performed.

Notes:
Isohemagglutinin titers contain both IgM and IgG. Both IgG and IgM titers will be performed for this test. If only IgM or IgG titer is desired, order Isohemagglutinin Titer, IgG (2000271) or Isohemagglutinin Titer, IgM (2000270). Specimens are screened for antibodies; if positive, an antibody panel will be performed. Titers will be performed as indicated for specific blood groups. Additional charges will apply to antibody identification and titer testing.

Isopropanol, plasma

LAB3469

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- LAB3469, ISP, Rubbing Alcohol
- LAB3469-VML
- LAB3469VML

Turn Around Time:
6 hours after sample received in lab

SPECIMEN REQUIREMENTS

Patient Preparation:
A non-alcohol based cleanser should be used to clean the venipuncture site prior to collection.

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Specimens should be delivered to the lab immediately and should be centrifuged and separated within 2 hours of collection. (Minimum 0.5 mL plasma)

Pediatric Collection:
Dark green microtainer (Sodium heparin)

Storage/Transport Temperature:
Refrigerated (2-8°C) if not delivered to the lab immediately

Performed:
Daily

Stability:
After separation from cells: Refrigerated (2-8°C): 7 days

Specimen:
Plasma

Alternate Specimen:
Gray tube (Sodium fluoride) or red tube (no gel)

ORDERING

Ordering Indicators:
This test is used in the confirmation of isopropanol (rubbing alcohol) ingestion.

Synonyms:

- LAB3469, ISP, Rubbing Alcohol
- LAB3469-VML
- LAB3469VML

Performed:
Daily

Turn Around Time:
6 hours after sample received in lab

Methodology:
GC/FID

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
None detected (< 10 mg/dL)

Interpretive Data:
In the case of isopropanol ingestion, acetone is produced metabolically and both acetone and isopropanol concentrations may be of clinical significance.

Methodology:
GC/FID

ADDITIONAL INFORMATION

Section:
Special Chemistry

Alternate Specimen:

Itraconazole, Quantitative by LC-MS/MS

LAB3775

ORDERING INFO

Collect:
Plain Red, Lavender (EDTA), or Green (Sodium or Lithium Heparin).

Synonyms:

- Antifungal Serum Level
- itranconazole blood level
- Sporanox
- sporanox blood concentration
- Sporanox blood level
- LAB3775-VML
- LAB3775VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain Red, Lavender (EDTA), or Green (Sodium or Lithium Heparin).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.6 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, Light Blue (citrate), or Yellow (SPS or ACD solution).

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 48 hours; Frozen: 6 months

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- Antifungal Serum Level
- itranconazole blood level
- Sporanox
- sporanox blood concentration
- Sporanox blood level
- LAB3775-VML
- LAB3775VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Tue, Thu, Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 15, 2011

Therapeutic Ranges	
Itraconazole (trough) - Localized Infection	Greater than 0.5 µg/mL
Itraconazole (trough) - Systemic Infection	Greater than 1.0 µg/mL
Hydroxyitraconazole	No therapeutic range established

Interpretive Data:
Itraconazole is an azole antifungal drug indicated to treat fungal infections. The therapeutic range is based on serum, predose (trough) draw collection at steady-state concentration. The pharmacokinetics of itraconazole are influenced by drug-drug interactions when coadministered with drugs metabolized by cytochrome P450 3A4 enzyme. Itraconazole and hydroxyitraconazole concentrations combined should not exceed 10 µg/mL. Adverse effects may include nausea, abdominal pain, and congestive heart failure.

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

JAK2 (V617F) Mutation Analysis, Whole blood, bone marrow

LAB3036

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3036, JK2, Janus-kinase 2 gene, V617F
- LAB3036-VML
- LAB3036VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

Two Lavender microtainers (EDTA) or bone marrow

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Once per week - variable days

Stability:

EDTA and AC-A: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C

Specimen:

Whole blood or bone marrow

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

Clinical suspicion/laboratory evidence of myeloproliferative neoplasms or otherwise unexplained thrombocytoses or erythrocytoses.

Synonyms:

- LAB3036, JK2, Janus-kinase 2 gene, V617F
- LAB3036-VML
- LAB3036VML

Performed:

Once per week - variable days

Turn Around Time:

10 days

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of JAK2 V617F; Laboratory Developed Test.

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This assay will detect the presence of the V617F allele of the JAK2 gene with a sensitivity of approximately 2-3%.

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of JAK2 V617F; Laboratory Developed Test.

JC Virus by PCR

LAB3865

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA) or serum separator tube. OR CSF or urine.

Synonyms:

- JCV
- JC Virus PCR
- John Cunningham Virus
- LAB3865-VML
- LAB3865VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA) or serum separator tube. OR CSF or urine.

Specimen Preparation:
Separate serum or plasma from cells. Transfer 1 mL serum, plasma, CSF or urine to a sterile container. (Min: 0.5 mL)

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 5 days; Frozen: 30 days

Performed:
Mon, Wed, Fri

Remarks:
Specimen source required.

ORDERING

Synonyms:

- JCV
- JC Virus PCR
- John Cunningham Virus
- LAB3865-VML
- LAB3865VML

Ordering Recommendations:
Detect JC virus in CSF, serum, or urine specimens.

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-4 days

RESULTS INTERPRETATION

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Jo-1 Antibody, IgG

LAB3776

ORDERING INFO

Collect:
Serum separator tubes.

Synonyms:

- Synthetase Antibody
- Jo 1 Antibodies
- Polymyositis Antibodies
- Anti-Jo-1 Antibody
- Antibodies to Jo 1 Antigen
- Autoantibodies to Jo 1 Antigen
- Histidyl-tRNA Synthetase Antibodies
- LAB3776-VML
- LAB3776VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tubes.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Plasma or other body fluids.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from the cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Synthetase Antibody
- Jo 1 Antibodies
- Polymyositis Antibodies
- Anti-Jo-1 Antibody
- Antibodies to Jo 1 Antigen
- Autoantibodies to Jo 1 Antigen
- Histidyl-tRNA Synthetase Antibodies
- LAB3776-VML
- LAB3776VML

Ordering Recommendations:
Recommended first-line test for the evaluation of polymyositis or inflammatory myopathies.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Multiplex Bead Assay

Reported:
1-3 days

Notes:
Presence of Jo-1 antibody is found in patients with pure polymyositis, pure dermatomyositis, or myositis associated with another rheumatic disease or with interstitial lung disease.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Jo-1 (Histidyl-tRNA Synthetase) Ab, IgG	40 AU/mL or less

Interpretive Data:

Presence of Jo-1 (antihistidyl transfer RNA [t-RNA] synthetase) antibody is associated with polymyositis and may also be seen in patients with dermatomyositis. Jo-1 antibody is associated with pulmonary involvement (interstitial lung disease), Raynaud phenomenon, arthritis, and mechanic's hands (implicated in antisynthetase syndrome).

Component	Interpretation
Jo-1 Antibody, IgG	29 AU/mL or less Negative 30-40 AU/mL Equivocal 41 AU/mL or greater Positive

Keppra (Levetiracetam)

LAB6061

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Synonyms:

- anti-epileptic
- Keppra
- keppra blood concentration
- Keppra concentration
- Keppra level, Keppra blood level
- Levetiracetam
- LAB6061-VML
- LAB6061VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Serum or plasma separator tubes. Grossly hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 7 days; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- anti-epileptic
- Keppra
- keppra blood concentration
- Keppra concentration
- Keppra level, Keppra blood level
- Levetiracetam
- LAB6061-VML
- LAB6061VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
Effective February 22, 2022

Therapeutic range: : 10-40 µg/mL
Toxic: Not well established

Interpretive Data:
Pharmacokinetics of levetiracetam are affected by renal function. Adverse effects may include somnolence, weakness, headache and vomiting.

This levetiracetam (Keppra) immunoassay uses the ARK Diagnostics reagents, which has known cross-reactivity with the drug brivaracetam (Briviact) and may report inaccurate results. Patients transitioning from levetiracetam to brivaracetam or those who are using both medications should not monitor drug concentrations with the ARK Diagnostics assay. These patients should be monitored using a validated chromatographic methodology that distinguishes between drugs to determine drug concentrations.

Methodology:
Quantitative Enzyme Immunoassay

KIT (D816V) Mutation Analysis, Whole blood, bone marrow

LAB3037

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3037, K17, KIT exon 17, D816V
- LAB3037-VML
- LAB3037VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

Two Lavender microtainers (EDTA) or bone marrow

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Once per week - variable days

Stability:

EDTA and AC-A: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C

Specimen:

Whole blood or bone marrow

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

Clinical suspicion/laboratory evidence of mastocyosis, gastrointestinal stromal tumor, or certain hematologic malignancies.

Synonyms:

- LAB3037, K17, KIT exon 17, D816V
- LAB3037-VML
- LAB3037VML

Performed:

Once per week - variable days

Turn Around Time:

10 days

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of KIT D816V; Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This assay will detect the presence of the D816V allele of the KIT gene with a sensitivity of approximately 2-3%.

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of KIT D816V; Laboratory Developed Test

Lacosamide, Serum or Plasma

LAB3777

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2EDTA).

Synonyms:

- Lacosamide blood level
- vimpat blood level
- Vimpat
- LAB3777-VML
- LAB3777VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated: Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 2 weeks

Performed:
Mon-Fri

ORDERING

Synonyms:

- Lacosamide blood level
- vimpat blood level
- Vimpat
- LAB3777-VML
- LAB3777VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Mon-Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 15, 2021

Therapeutic Range:	Not well established. Suggested range 1.0-10.0 µg/mL
Toxic Level	Greater than or equal to 20 µg/mL

Interpretive Data:
Lacosamide is an anticonvulsant drug indicated for adjunctive therapy for partial-onset seizures. The therapeutic range is based on serum, predose (trough) draw collection at steady-state concentration. Adverse effects may include dizziness, fatigue, nausea, vomiting, blurred vision, and tremor.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Lactate Dehydrogenase, Isoenzymes

LAB97

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plain Red.

Synonyms:

- Lactate Dehydrogenase Isoenzymes, S
- LDH
- LDH Fractionation
- LDH Isoenzymes
- Isoenzymes
- Isoenzymes of Lactate Dehydrogenase
- Isoenzymes, LD
- LD
- LAB97-VML
- LAB97VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Do not refrigerate or freeze. Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.6 mL)

Unacceptable Conditions:
Hemolyzed specimens.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
After separation of cells: Ambient: 1 week; Refrigerated: Unacceptable; Frozen: Unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- Lactate Dehydrogenase Isoenzymes, S
- LDH
- LDH Fractionation
- LDH Isoenzymes
- Isoenzymes
- Isoenzymes of Lactate Dehydrogenase
- Isoenzymes, LD
- LD
- LAB97-VML
- LAB97VML

Ordering Recommendations:
Do not use to detect myocardial injury. In rare cases, this test may be used to evaluate elevated lactate dehydrogenase associated with noncardiac muscle injury. Troponin testing is recommended for diagnosis and management of acute coronary syndrome; refer to Troponin T (cTnT) 5th Generation (3001831).

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay/Electrophoresis

Reported:
1-2 days

Notes:
LD-1 and LD-2 are elevated in hemolyzed specimens and serum which has not been separated from cells. LD-3, LD-4, and LD-5 are labile at low temperatures, and are erroneously low in specimens that have been refrigerated or frozen.

RESULTS INTERPRETATION

Reference Interval:

LD-1: 14-27%
LD-2: 29-42%
LD-3: 18-30%
LD-4: 8-15%
LD-5: 6-23%

Red (No Gel)

Additional Information:
In connection with certain diseases (e.g. hepatopathy, diseases of skeletal muscle, malignant tumors), the LDH 4 and LDH 5 isoenzymeportions are increased and unstable in cooled and frozen samples; this may lead to an incorrect LDH value in samples collected from patients suffering from such diseases.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.3 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Preferred Collection Volume:
Fill to Indicator Line

Alternate Specimen:
Red (No Gel)

Patient Preparation:
N/A

Specimen:
Plasma or Serum

Reasons for Rejection:
Hemolysis, improper collection, QNS, sample outside of stability limits

Components:
N/A

Stability:
After separation from cells: 15° to 25°C: 7 days; 2° to 8°C: 4 days; Frozen: 6 weeks

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Synonyms:

- LDH, Lactic Dehydrogenase (LDH) Blood, LAB96
- LAB96-VML
- LAB96VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Ordering Indicators:

Lamotrigine

LAB6060

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Synonyms:

- Lamictal
- LAB6060-VML
- LAB6060VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Serum or plasma separator tubes. Grossly hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 7 days; Refrigerated: 1 week; Frozen: 4 weeks

Performed:
Sun-Sat

ORDERING

Synonyms:

- Lamictal
- LAB6060-VML
- LAB6060VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
Effective February 22, 2022

Therapeutic Range: 3-15.0 µg/mL
Toxic: Greater than or equal to 20 µg/mL

Interpretive Data:
Pharmacokinetics varies widely, particularly with co-medications and/or compromised renal function. Adverse effects may include dizziness, somnolence, nausea and vomiting.

Methodology:
Quantitative Enzyme Immunoassay

LDL Cholesterol - Direct, Plasma or Serum

LAB102

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- LDL, Low Density Lipoprotein Cholesterol, LAB102
- LAB102-VML
- LAB102VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting is preferred but not required unless directed by the ordering provider.

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 2° to 8°C: 5 days; -80°C: 3 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:
Useful to assess cardiovascular disease risk and guide therapy.

Synonyms:

- LDL, Low Density Lipoprotein Cholesterol, LAB102
- LAB102-VML
- LAB102VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Lead, Blood (Capillary)

LAB5771

ORDERING INFO

Collect:
Lavender microtainer (K_2EDTA)

Synonyms:

- Pb, Pediatric
- Pb, Whole Blood
- BLL
- Capillary blood level
- Lead (Pediatric)
- Pb
- Pb, Blood
- LAB5771-VML
- LAB5771VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Clean puncture site well with soap and water before collection procedure begins.

Collect:
Lavender microtainer (K_2EDTA)

Specimen Preparation:
Invert specimen 10 times to prevent clot formation. Transport 0.5 mL whole blood in the original collection tube. (Min: 0.3 mL)

Unacceptable Conditions:
Specimens collected in tubes other than lavender microtainer (K_2EDTA). Specimens transported in tubes other than trace element-free transport tubes or lavender microtainer (K_2EDTA) tubes. Heparin anticoagulant. Clotted specimens. Venous whole blood, refer to Lead, Blood (Venous) (ARUP test code 0020098).

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Trace Elements requisition form may be required (ARUP form #32990).

ORDERING

Synonyms:

- Pb, Pediatric
- Pb, Whole Blood
- BLL
- Capillary blood level
- Lead (Pediatric)
- Pb
- Pb, Blood
- LAB5771-VML
- LAB5771VML

Ordering Recommendations:
Recommended routine screening for lead exposure in pediatric populations. Confirm elevated results with Lead, Blood (Venous) (0020098).

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective December 6, 2021

0-5 years	Less than or equal to 3.4 µg/dL
6 years or above	Less than or equal to 4.9 µg/dL

Interpretive Data:

Analysis performed by inductively coupled plasma-mass spectrometry (ICP-MS).

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified lead-free collection/transport tube. If contamination concerns exist due to elevated levels of blood lead, confirmation with a venous specimen collected in a certified lead-free tube is recommended.

Repeat testing is recommended prior to initiating chelation therapy or conducting environmental investigations of potential lead sources. Repeat testing collections should be performed using a venous specimen collected in a certified lead-free collection tube.

Information sources for blood lead reference intervals and interpretive comments include the CDC's "Childhood Lead Poisoning Prevention: Recommended Actions Based on Blood Lead Level" and the "Adult Blood Lead Epidemiology and Surveillance: Reference Blood Lead Levels (BLLs) for Adults in the U.S." Thresholds and time intervals for retesting, medical evaluation, and response vary by state and regulatory body. Contact your State Department of Health and/or applicable regulatory agency for specific guidance on medical management recommendations.

Children	
Concentration	**Comment**
3.5-19.9 µg/dL	Children under the age of 6 years are the most vulnerable to the harmful effects of lead exposure. Environmental investigation and exposure history to identify potential sources of lead. Biological and nutritional monitoring are recommended. Follow-up blood lead monitoring is recommended.
20-44.9 µg/dL	Lead hazard reduction and prompt medical evaluation are recommended. Contact a Pediatric Environmental Health Specialty Unit or poison control center for guidance.
Greater than 44.9 µg/dL	Critical. Immediate medical evaluation, including detailed neurological exam is recommended. Consider chelation therapy when symptoms of lead toxicity are present. Contact a Pediatric Environmental Health Specialty Unit or poison control center for assistance.

Adults	
Concentration	**Comment**
5-19.9 µg/dL	Medical removal is recommended for pregnant women or those who are trying or may become pregnant. Adverse health effects are possible. Reduced lead exposure and increased blood lead monitoring are recommended.
20-69.9 µg/dL	Adverse health effects are indicated. Medical removal from lead exposure is required by OSHA if blood lead level exceeds 50 µg/dL. Prompt medical evaluation is recommended.
Greater than 69.9 µg/dL	Critical. Immediate medical evaluation is recommended. Consider chelation therapy when symptoms of lead toxicity are present.

Lead, Urine

LAB404

ORDERING INFO

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Synonyms:

- Pb
- Lead/Creatinine Ratio, Random, Urine
- Normalized Urine Lead
- Pb urine
- urine lead concentration
- LAB404-VML
- LAB404VML

SPECIMEN REQUIREMENTS

Patient Preparation:

Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician). High concentrations of iodine may interfere with elemental testing. Collection of urine specimens from patients receiving iodinated or gadolinium-based contrast media should be avoided for a minimum of 72 hours post-exposure. Collection from patients with impaired kidney function should be avoided for a minimum of 14 days post-contrast media exposure.

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Specimen Preparation:

Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL)

Unacceptable Conditions:

Urine collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Acid preserved urine. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element free transport tube (with the exception of the original device).

Storage/Transport Temperature:

Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):

Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Performed:

Sun-Sat

Remarks:

Trace Elements requisition form may be required (ARUP form #32990-Barcode; #32991-No Barcode). Record total volume and collection time interval on transport tube and on test request form.

ORDERING

Synonyms:

- Pb
- Lead/Creatinine Ratio, Random, Urine
- Normalized Urine Lead
- Pb urine
- urine lead concentration
- LAB404-VML
- LAB404VML

Ordering Recommendations:

May be useful in the assessment of chronic lead exposure or in monitoring chelation therapy. For routine testing of lead exposure, Lead, Blood (Venous) (0020098) is preferred. For occupational exposure, consider Lead, Industrial Exposure Panel, Adults (0025016).

Performed:

Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Creatinine, Urine - per 24h	See table below
Lead, Urine - per 24h	0.0-8.1 µg/d
Lead, Urine - per volume	0.0-5.0 µg/L
Lead, Urine - ratio to CRT	0.0-5.0 µg/g CRT

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Interpretive Data:
Quantification of urine excretion rates before or after chelation therapy has been used as an indicator of lead exposure. Urinary excretion of >125 mg of lead per 24 hours is usually associated with related evidence of lead toxicity.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Leflunomide Metabolite, Serum or Plasma

LAB3779

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), green (sodium heparin), or gray (sodium fluoride).

Synonyms:

- Arava
- Arava® (Leflunomide (Teriflunomide), Serum or Plasma)
- leflunomide blood concentration
- Teriflunomide
- LAB3779-VML
- LAB3779VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Predose (trough). Obtain specimen 12 - 24 hours after last dose.

Collect:
Plain red. Also acceptable: Lavender (EDTA), pink (K_2EDTA), green (sodium heparin), or gray (sodium fluoride).

Specimen Preparation:
Separate from cells within 2 hours of draw. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Whole blood. Potassium oxalate or separator tubes.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 7 days; Refrigerated: 17 days; Frozen: 90 days

Performed:
Sun, Wed, Fri

ORDERING

Synonyms:

- Arava
- Arava® (Leflunomide (Teriflunomide), Serum or Plasma)
- leflunomide blood concentration
- Teriflunomide
- LAB3779-VML
- LAB3779VML

Ordering Recommendations:
Therapeutic monitoring and evaluating full elimination of the drug (eg, toxicity, pregnancy).

Performed:
Sun, Wed, Fri

Methodology:
Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:

Therapeutic Range	Greater than 40.000 µg/mL
Toxic Level	Not well established.

Interpretive Data:

Therapeutic and toxic ranges are not well established. Concentrations greater than 40.000 µg/mL tend to correlate with improved patient outcome. A proposed therapeutic range is 50.000 - 100.000 µg/mL. Adverse reactions to Leflunomide, such as diarrhea, hypertension, and liver toxicity, do not correlate well with serum drug concentrations. Leflunomide has a potential risk for teratogenesis. For women being treated with Leflunomide who desire to become pregnant, enhanced drug elimination should be performed until plasma teriflunomide concentrations are lower than 0.020 µg/mL on two separate tests taken at least 14 days apart.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Interpretive Data:

Therapeutic and toxic ranges are not well established. Concentrations greater than 40.000 µg/mL tend to correlate with improved patient outcome. A proposed therapeutic range is 50.000 - 100.000 µg/mL. Adverse reactions to Leflunomide, such as diarrhea, hypertension, and liver toxicity, do not correlate well with serum drug concentrations. Leflunomide has a potential risk for teratogenesis. For women being treated with Leflunomide who desire to become pregnant, enhanced drug elimination should be performed until plasma teriflunomide concentrations are lower than 0.020 µg/mL on two separate tests taken at least 14 days apart.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Reference Interval:

Therapeutic Range	Greater than 40.000 µg/mL
Toxic Level	Not well established.

Methodology:

Liquid Chromatography-Tandem Mass Spectrometry

Section:

RF-ARUP

CPT Codes:

80193

Legionella Species by Qualitative PCR

LAB3168

ORDERING INFO

Collect:
Respiratory specimen: Bronchoalveolar lavage (BAL), bronchial brushings, nasopharyngeal swab, sputum, tracheal aspirates or pleural fluid.

Synonyms:

- Legionella pneumophila (Legionella Species by PCR)
- LAB3168-VML
- LAB3168VML

SPECIMEN REQUIREMENTS

Collect:
Respiratory specimen: Bronchoalveolar lavage (BAL), bronchial brushings, nasopharyngeal swab, sputum, tracheal aspirates or pleural fluid.

Specimen Preparation:
Fluid: Transfer 2 mL respiratory specimen to a sterile container. (Min: 0.5 mL) Also acceptable: Transfer to viral transport media (ARUP supply #12884).
Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787.
Swabs: Place in viral transport media.

Unacceptable Conditions:
Tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 5 days; Frozen: 6 months

Performed:
Sun-Sat

Remarks:
Specimen source required, tissues in optimal cutting temperature compound.

ORDERING

Synonyms:

- Legionella pneumophila (Legionella Species by PCR)
- LAB3168-VML
- LAB3168VML

Ordering Recommendations:
Detect Legionella species.

Performed:
Sun-Sat

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-2 days

Notes:
This test detects and speciates L. pneumophila. The nucleic acid from other Legionella species will be detected by this test but cannot be differentiated

RESULTS INTERPRETATION

Interpretive Data:
A negative result does not rule out the presence of PCR inhibitors in the patient specimen or test-specific nucleic acid in concentrations below the level of detection by this test.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Qualitative Polymerase Chain Reaction

Leptin, Quantitative by Chemiluminescent Immunoassay

LAB3781

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- Leptin
- leptin resistance
- LAB3781-VML
- LAB3781VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should fast overnight prior to collection.

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Non-fasting specimens. Icteric or severely hemolyzed specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 48 hours; Frozen: 2 months

Performed:
Mon, Thu

Leukocyte Adhesion Deficiency Panel

LAB3782

ORDERING INFO

Collect:
Green (Na heparin) or purple (KEDTA).

Synonyms:

- Beta 2 integrins
- LAD I, II determination
- CD11a, CD11b; CD15s; CD18
- CD11a, CD11b
- CD15s
- CD18
- LAB3782-VML
- LAB3782VML

SPECIMEN REQUIREMENTS

Collect:
Green (Na heparin) or purple (KEDTA).

Specimen Preparation:
Transport 5 mL whole blood. (Min: 1 mL) Specimen must be analyzed within 72 hours of collection.

Unacceptable Conditions:
Clotted or hemolyzed specimens. Frozen specimens.

Storage/Transport Temperature:
Room temperature or refrigerated.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 72 hours; Frozen: Unacceptable.

Performed:
Sun-Sat

ORDERING

Synonyms:

- Beta 2 integrins
- LAD I, II determination
- CD11a, CD11b; CD15s; CD18
- CD11a, CD11b
- CD15s
- CD18
- LAB3782-VML
- LAB3782VML

Ordering Recommendations:
Aids in the diagnosis of type I and II leukocyte adhesion deficiency. Panel measures CD11a, CD11b, CD15s, and CD18 on neutrophils.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Flow Cytometry

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
% CD18	99-100
% CD11b	96-100
% CD15s	95-100
% CD11a	97-100

Interpretive Data:
The Leukocyte Adhesion Deficiency Panel measures the receptors CD11a, CD11b, CD15s, and CD18 normally found on neutrophils. The percentage of patient neutrophils bearing these receptors is reported. Decreased values outside of the reference interval may correlate with abnormal neutrophil function. For example, CD11 and CD18 are decreased or absent in leukocyte adhesion deficiency (LAD) type I and CD15s is decreased or absent in LAD type II.

Methodology:
Semi-Quantitative Flow Cytometry

Leukocyte Alkaline Phosphatase (Test on Delay as of 7/21/2023)

LAB763

ORDERING INFO

Collect:
Green (sodium or lithium heparin).

Synonyms:

- LAP
- LAB763-VML
- LAB763VML

SPECIMEN REQUIREMENTS

Collect:
Green (sodium or lithium heparin).

Specimen Preparation:
Protect both smears and whole blood from light and pack accordingly to avoid breakage. Transport 5 mL whole blood (Min: 1 mL) AND 6 unfixed, well-prepared smears (Min: 6 smears)

Unacceptable Conditions:
Specimens collected in EDTA. Poorly prepared smears (too thick or no feather edge). Broken or fixed smears. Specimens that have been spun. Smears made from anything other than heparin. Smears made from blood older than 24 hours. Whole blood not protected from light. Smears not protected from light.

Storage/Transport Temperature:
Room temperature. Send Sunday through Thursday only. Whole blood must be received within 24 hours of collection; smears must be made within 24 hours of collection and received within 7 days of collection.

Stability (from collection to initiation):
Blood: Ambient: 24 hours; Refrigerated: Unacceptable; Frozen: Unacceptable
Unfixed Smears: Ambient: 1 week; Refrigerated: Unacceptable; Frozen: Unacceptable

Performed:
Mon-Fri

Remarks:
Further information on how to make an adequate smear can be found in the following instructional video: https://www.youtube.com/watch?v=ca3NwrlpS40&feature=youtube

LIQUID BASE CYTOLOGY, THIN PREP PAP

ORDERING INFO

Collect:
Gyn ThinPrep preservcyt vial

Synonyms:

- GYN, Pap smear, Thin prep, GYN, Liquid-based pap, Conventional pap smear, Cytology

Turn Around Time:
7 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Gyn ThinPrep preservcyt vial

Specimen Preparation:
1. A plastic cervical spatula and endocervical brush combination or a single Wallach broom are used to sample the cervix, endocervix, and (if needed) the vagina. 2. The collection devices are vigorously rinsed in a GYN ThinPrep vial. 3. Place Epic order for Cytology GYN Pap. 4. Indicate specimen source and laterality when completing the collection task in Epic. 5. Specimen vial is to be labeled with generic ADT label. 6. Please send Epic requisition and specimen vial to the lab. Visit www.hologic.com for clinical information regarding the ThinPrep Pap. (Minimum: 1 GYN ThinPrep vial)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C).

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) 6 weeks

Specimen:
Gyn sample in ThinPrep vial

Alternate Specimen:
Conventional Pap; Specimen may be collected as a smear on a glass slide labeled with two patient identifiers. Slides must be fixed immediately with spray fixative or by placing slides in 95% alcohol. HPV testing can not be performed on a conventional Pap smear.

ORDERING

Ordering Indicators:
Lab must have presenting ICD-10 code and specimen source to be able to process specimen. For optimal patient care we must have patient's age, first date of LMP, and any significant clinical history.

Synonyms:

- GYN, Pap smear, Thin prep, GYN, Liquid-based pap, Conventional pap smear, Cytology

Performed:
Monday-Friday

Turn Around Time:
7 days

Methodology:
ThinPrep procedure

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
This test shows morphological characteristics reflecting benign and malignant disease processes.

Methodology:
ThinPrep procedure

ADDITIONAL INFORMATION

Liver-Kidney Microsome Antibody, IgG

LAB3783

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Liver-Kidney Microsome antibody, IgG IIF
- LKM antibody, IgG IIF
- LKM IgG IIF
- Liver-Kidney Microsome antibody, IgG IFA
- LKM antibody, IgG IFA
- LKM IgG IFA
- LAB3783-VML
- LAB3783VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Unacceptable Conditions:
Severely hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon-Sat

ORDERING

Synonyms:

- Liver-Kidney Microsome antibody, IgG IIF
- LKM antibody, IgG IIF
- LKM IgG IIF
- Liver-Kidney Microsome antibody, IgG IFA
- LKM antibody, IgG IFA
- LKM IgG IFA
- LAB3783-VML
- LAB3783VML

Ordering Recommendations:
Differential evaluation of autoimmune liver disease of unknown etiology, especially autoimmune hepatitis (AIH) of childhood onset. Use in combination with Liver Cytosolic Antigen Type 1 (LC-1) Antibody, IgG (2010711) when evaluating for AIH-2.

Performed:
Mon-Sat

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
Less than 1:20 Normal

Interpretive Data:
Liver-Kidney Microsome IgG antibody (anti-LKM), as detected by indirect immunofluorescent antibody (IFA) techniques, may be observed in patients with autoimmune hepatitis type 2 (AIH-2), AIH-2 associated with autoimmune polyendocrinopathy-candidiasis-ectodermal dystrophy (APECED), viral hepatitis C or D, and some forms of drug-induced hepatitis. This IFA does not differentiate among the four types of LKM antibodies (LKM-1, LKM-2, LKM-3, and a fourth type that recognizes CYP1A2 and CYP2A6 antigens). Of these, anti-LKM-1 (cytochrome P450IID6) IgG antibodies are considered specific for AIH-2.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Low Molecular Wwight Heparin Level

LAB316

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB316, Low Molecular Weight Heparin Assay, LMW Heparin Level, Lovenox Level, Anti-Xa Assay
- LAB316-VML
- LAB316VML

Turn Around Time:

2 hours once received into lab

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. Process the sample carefully to avoid platelet activation during centrifugation. PF-4 released from the platelet granules is a potent heparin inhibitor, and release of PF-4 may result in an underestimate of the LMWH level. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

ORDERING

Ordering Indicators:

This test on its own is not adequate for the evaluation of the Antiphospholipid Antibody Syndrome. A more appropriate test for work up of Antiphospholipid Antibody Syndrome is the Antiphospholipid Ab Pnl [LAB2307].

Synonyms:

- LAB3447, RVV, DRVVT, Lupus Anticoagulant DRVVT
- LAB3447-VML
- LAB3447VML

Performed:
Twice per week - variable days

Turn Around Time:
1 -3 days

Methodology:
Clotting

Components:
dRVVT reflex to 1:1 dRVVT mixing study, and dRVVT confirmirmatory testing if indicated.

RESULTS INTERPRETATION

Reference Interval:
Ratio 0.7 - 1.2

Interpretive Data:
Direct IIa (thrombin) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. Factor VIII levels > 200% may result in a false negative dRVVT result. The presence of Hemlibra (emicizumab) may affect the assay.

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
A positive test (ratio > 1.2) will generate reflex testing for confirmation. Request for in-patient testing must be approved by the Coagulation Medical Director on-call. (Refer to Synergy for contact informtation.) Request for testing can be submitted via the following link: redcap.link/misc-coag.

Components:
dRVVT reflex to 1:1 dRVVT mixing study, and dRVVT confirmirmatory testing if indicated.

dRVVT reflex to 1:1 dRVVT mixing study, and dRVVT confirmirmatory testing if indicated.

Stability:
Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Storage/Transport Temperature:
Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Synonyms:

- LAB3447, RVV, DRVVT, Lupus Anticoagulant DRVVT
- LAB3447-VML
- LAB3447VML

Performed:
Twice per week - variable days

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 -3 days

Ordering Indicators:
This test on its own is not adequate for the evaluation of the Antiphospholipid Antibody Syndrome. A more appropriate test for work up of Antiphospholipid Antibody Syndrome is the Antiphospholipid Ab Pnl [LAB2307].

Interpretive Data:
Direct IIa (thrombin) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. Factor VIII levels > 200% may result in a false negative dRVVT result. The presence of Hemlibra (emicizumab) may affect the assay.

Reference Interval:
Ratio 0.7 - 1.2

Additional Information:
A positive test (ratio > 1.2) will generate reflex testing for confirmation. Request for in-patient testing must be approved by the Coagulation Medical Director on-call. (Refer to Synergy for contact informtation.) Request for testing can be submitted via the following link: redcap.link/misc-coag.

Methodology:
Clotting

Lupus Anticoagulant STAClot LA

LAB478

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB478, Hexagonal Phase Phospholipid Testing, LAS, LASTA Clot
- LAB478-VML
- LAB478VML

Turn Around Time:

1 - 6 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, double centrifugation is required. Transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Twice per week - variable days

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

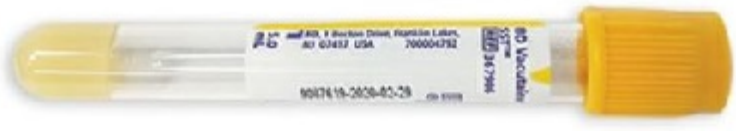
Luteinizing Hormone, Serum

LAB87

ORDERING INFO

Collect:
Gold (Clot Activator with Gel)



Synonyms:

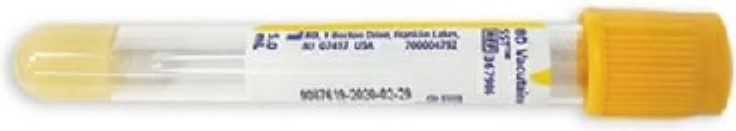
- LH, Luteinizing Hormone Blood, LAB87
- LAB87-VML
- LAB87VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Samples should not be taken from patients taking biotin until at least 8 hours following the last dose.

Collect:
Gold (Clot Activator with Gel)



Specimen Preparation:
Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.5 mL)

Pediatric Collection:
1 Gold Microtainer (Clot Activator with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 14 days; 2° to 8°C: 4 days; Frozen: 6 months

Specimen:
Serum

Alternate Specimen:

Lymphocyte Subset Panel - T-Cell Subsets (CD4 and CD8) enumeration

LAB3455

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB3455, CD3, CD4, CD8
- LAB3455-VML
- LAB3455VML

Turn Around Time:
24 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Fill tube to indicator line and mix well. (Min >1.0ml Blood)

Pediatric Collection:
Two Lavender microtainerss (EDTA)

Storage/Transport Temperature:
Ambient (15-25°C) or refrigerated (2-8°C)

Performed:
Monday - Saturday

Stability:
Ambient: (15-25°C): 48 hours

Specimen:
Blood, BAL

Alternate Specimen:
Yellow Top (ACD-A)

ORDERING

Ordering Indicators:
This test identifies and enumerates CD3+ T cells (including CD4 and CD8 subsets).

Synonyms:

- LAB3455, CD3, CD4, CD8
- LAB3455-VML
- LAB3455VML

Performed:
Monday - Saturday

Turn Around Time:
24 hours

Methodology:
Flow Cytometry Immunophenotyping

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Peripheral blood: 1 day to 2 years: CD3: 58-69%, 1700-3600/mm(3) ; CD4, 30-50%, 1000-2800/ mm(3); CD8: 18-32%, 800-1500/ mm(3); 7 years to 70: CD3: 66-82%, 700-2372 /mm(3); CD4: 35-55%, 410-1572/ mm(3); CD8: 20-36%, 116-961/ mm(3)

Interpretive Data:
The CD4 cells are helper T cells expressing both CD3 and CD4. The CD8 cells are cytotoxic T cells expressing both CD3 and CD8. CD4 and CD8 T-cell percentages are reported as a percent of total lymphocytes. CD4 T-cell levels are a criterion for categorizing HIV-related clinical conditions by the CDC's classification system for HIV infection. The measurement of CD4 T-cell levels has been used to establish decision points for initiating P. jirovecii prophylaxis, antiviral therapy and to monitor the efficacy of treatment. The Public Health Service (PHS) has recommended that CD4 T-cell levels be monitored every 3 to 6 months in all HIV-infected persons. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Flow Cytometry Immunophenotyping

ADDITIONAL INFORMATION

Section:

Lymphocytic Choriomeningitis (LCM) Virus Antibodies, IgG & IgM

LAB3778

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- LCM Antibodies, Serum
- LAB3778-VML
- LAB3778VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min 0.2 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Tue, Fri

ORDERING

Synonyms:

- LCM Antibodies, Serum
- LAB3778-VML
- LAB3778VML

Ordering Recommendations:
Aid in the diagnosis of lymphocytic choriomeningitis (LCM) viral infection.

Performed:
Tue, Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
LCM Virus Ab, IgG	Less than 1:10
LCM Virus Ab, IgM	Less than 1:10

Interpretive Data:

The best evidence for current infection is a significant change on two appropriately timed specimens, where both tests are done in the same laboratory at the same time.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Lymphocytic Choriomeningitis (LCM) Virus Antibody, IgG	< 1:10 Negative - No significant level of LCM virus IgG antibody detected. >= 1:10 Positive - Presence of IgG antibody to LCM virus detected, suggestive of current or past infection.
Lymphocytic Choriomeningitis (LCM) Virus Antibody, IgM	< 1:10 Negative - No significant level of LCM virus IgM antibody detected. >= 1:10 Positive - Presence of IgM antibody to LCM virus detected, suggestive of current or past infection.

Methodology:

Semi-Quantitative Indirect Fluorescent Antibody

ADDITIONAL INFORMATION

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min 0.2 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:

Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:

Refrigerated.

Lysozyme, Serum

LAB1133

ORDERING INFO

Collect:
Serum separator tube (SST).

Synonyms:

- Serum lysozyme
- Muramidase serum
- LAB1133-VML
- LAB1133VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Unacceptable Conditions:
Hemolyzed, lipemic, icteric, or contaminated specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 5 days; Frozen: 1 month.

Performed:
Sun, Tue, Thu

ORDERING

Synonyms:

- Serum lysozyme
- Muramidase serum
- LAB1133-VML
- LAB1133VML

Ordering Recommendations:
Aids in diagnosis of acute myelocytic leukemia or other leukemias, sarcoidosis, and infections such as tuberculosis.

Performed:
Sun, Tue, Thu

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-5 days

Notes:
Serum lysozyme levels may be elevated in acute myelomonocytic leukemia (FAB-M4), chronic myelomonocytic leukemia (CMML), and chronic myelocytic leukemia (CML). Increased serum lysozyme activity is present in tuberculosis, sarcoidosis, megaloblastic anemias, acute bacterial infections, ulcerative colitis, regional enteritis, and Crohn disease. Elevated serum lysozyme occurs during severe renal insufficiency, renal transplant rejection, urinary tract infections, pyelonephritis, glomerulonephritis, and nephrosis.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Lysozyme, Serum	Less than or equal to 4.50 ug/mL

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Lysozyme, Serum	2.75 ug/mL or less ..... Negative 2.76 - 4.50 ug/mL ..... Equivocal 4.51 ug/mL or greater ..... Positive

Methodology:

Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

ADDITIONAL INFORMATION

CPT Codes:

Magnesium, RBC

LAB6096

ORDERING INFO

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Synonyms:

- Intracellular Magnesium
- MgRBCs
- LAB6096-VML
- LAB6096VML

SPECIMEN REQUIREMENTS

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Specimen Preparation:
Centrifuge whole blood and separate RBCs from plasma within 2 hours of collection. Transfer 2 mL RBCs to an ARUP Trace Element-Free Transport Tube (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 0.6 mL)

Unacceptable Conditions:
Specimens collected in tubes other than Royal blue (K2EDTA) or Royal blue (NaHep). Specimens transported in containers other than Royal blue (K2EDTA) or Royal blue (NaHep) tube or Trace Element-Free Transport Tube. Clotted or grossly hemolyzed specimens.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Stability (from collection to initiation):
After separation from plasma: Ambient: 2 weeks; Refrigerated: 2 weeks; Frozen: Unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- Intracellular Magnesium
- MgRBCs
- LAB6096-VML
- LAB6096VML

Ordering Recommendations:
May be useful in the assessment of tissue stores. For routine assessment of magnesium deficiency, Magnesium, Plasma or Serum (0020039) is preferred.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
3.6-7.5 mg/dL

Interpretive Data:
RBC magnesium results reflect the intracellular stores and general homeostasis of magnesium. Results may be falsely low if RBCs in the submitted specimen are lysed or not promptly separated from plasma.

RBC magnesium concentration is reported as milligrams per deciliter (mg/dL). To convert concentration to millimoles per liter (mmol/L), divide the result by 2.43.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes

Malaria Prep (thick and thin peripheral smear), Lavender tube (EDTA)

LAB1256

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- Malaria Prep, Malaria Smear, Thick and thin peripheral smears for malaria
- LAB1256-VML
- LAB1256VML

Turn Around Time:

1 day

SPECIMEN REQUIREMENTS

Patient Preparation:

Although optimum time to collect the specimen is midway between chills, blood collection should be performed immediately upon first suspicion of malaria. Since single blood films may not reveal organisms, successive films at 6, 12, or 24 hours are sometimes necessary.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Collection for whole blood: Collect while patient is midway between chills. Deliver to lab immediately (minimum 0.5 mL)

Pediatric Collection:

Lavendar microtainer (EDTA)

Storage/Transport Temperature:

Room temperature or refrigerated

Performed:

Daily

Stability:

Ambient: 1 hour after blood collection is ideal

Specimen:

Whole Blood

Alternate Specimen:

N/A

Manganese, Serum

LAB1050

ORDERING INFO

Collect:
Royal Blue (No Additive).

Synonyms:

- Mn
- Mn blood level
- MNS
- Serum manganese concentration
- LAB1050-VML
- LAB1050VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician).

Collect:
Royal Blue (No Additive).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Trace Element-Free Transport Tube (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Specimens that are not separated from clot, within 2 hours. Separator tubes or Royal Blue (EDTA). Specimens transported in tubes other than specified. Hemolyzed specimens.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Indefinitely

Performed:
Sun-Sat

ORDERING

Synonyms:

- Mn
- Mn blood level
- MNS
- Serum manganese concentration
- LAB1050-VML
- LAB1050VML

Ordering Recommendations:
May be useful as a reasonable indicator of recent, active exposure and provides a modest indicator for distinguishing exposed from nonexposed individuals. Not recommended for the assessment of manganese body stores. Manganese, Whole Blood (0099272) is recommended for monitoring potential accumulation with TPN.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
0.0-2.0 µg/L

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of serum manganese, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Less than 5 percent of manganese present in circulation resides in the serum.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Mannose Binding Lectin

LAB3786

ORDERING INFO

Collect:
Serum separator tube or plain red.

Synonyms:

- Mannan Binding Lectin
- Mannose-Binding Lectin, S MBL
- LAB3786-VML
- LAB3786VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plain red.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min 0.2 mL)

Unacceptable Conditions:
Nonserum, contaminated, or heat-inactivated specimens.

Storage/Transport Temperature:
Frozen. Also acceptable: Refrigerated if maintained at temperature for less than 7 days.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 7 days; Frozen: 30 days (avoid repeated freeze/thaw cycles)

Performed:
Tue

ORDERING

Synonyms:

- Mannan Binding Lectin
- Mannose-Binding Lectin, S MBL
- LAB3786-VML
- LAB3786VML

Ordering Recommendations:
Initial screening for suspected deficiency in the lectin complement pathway.

Performed:
Tue

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
Greater than or equal to 76 ng/mL

Interpretive Data:
Mannose-binding protein is a component of the innate or natural immune system which binds to mannose residues on a variety of different microorganisms. When bound, this lectin will trigger the complement pathway resulting in opsonization. Mannose-binding protein is also an acute phase reactant produced by the liver. Patients who have abnormal levels of mannose-binding protein may have recurrent significant infections in the absence of abnormalities in the four major arms of the immune system. Abnormal mannose-binding protein concentrations have been found in patients with infectious disorders such as tuberculosis and hepatitis B and in autoimmune disorders, including recurrent spontaneous abortion and systemic lupus erythematosis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Marijuana Metabolite, Umbilical Cord Tissue, Qualitative

LAB5847

ORDERING INFO

Collect:
Umbilical Cord (At least 8 inches, approximately the width of a sheet of paper.)

Synonyms:

- LAB5847-VML
- LAB5847VML

SPECIMEN REQUIREMENTS

Collect:
Umbilical Cord (At least 8 inches, approximately the width of a sheet of paper.)

Specimen Preparation:
Drain and discard any blood. Rinse the exterior of the cord segment with normal saline or water. Pat the cord dry and transport at least 8 inches of umbilical cord in a routine urine collection cup or Security Kit for Meconium/Umbilical Drug Detection (ARUP supply #51548) available online through eSupply using ARUP Connect(TM) or by contacting ARUP Client Services at (800) 522-2787. (Min: 6 inches)

Unacceptable Conditions:
Cords soaking in blood or other fluid. Formalin fixed. Tissue that is obviously decomposed.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 3 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- LAB5847-VML
- LAB5847VML

Ordering Recommendations:
Use to detect and document fetal exposure to THC during approximately the last trimester of a full-term pregnancy. For panel testing that includes THC metabolite, refer to Drug Detection Panel and THC Metabolite, Umbilical Cord Tissue, Qualitative (3006371).This test does not distinguish between the delta-8 and delta-9 forms of THC or their metabolites.

Performed:
Sun-Sat

Methodology:
Qualitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-3 days

Notes:
Absolute Minimum: 6 inches.

RESULTS INTERPRETATION

Reference Interval:

Drugs/Drug Classes	Cutoff Concentrations (ng/g)
THC-COOH	0.2

Interpretive Data:

Methodology: Qualitative Liquid Chromatography-Tandem Mass Spectrometry

This test is designed to detect and document exposure that occurred during approximately the last trimester of a full term pregnancy, to a common cannabis (marijuana) metabolite. Alternative testing is available to detect other drug exposures. The pattern and frequency of drug(s) used by the mother cannot be determined by this test. A negative result does not exclude the possibility that a mother used drugs during pregnancy. Detection of drugs in umbilical cord tissue depends on extent of maternal drug use, as well as drug stability, unique characteristics of drug deposition in umbilical cord tissue, and the performance of the analytical method. Drugs administered during labor and delivery may be detected. Detection of drugs in umbilical cord tissue does not insinuate impairment and may not affect outcomes for the infant. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

- Quad screening
- LAB5938-VML
- LAB5938VML

Ordering Recommendations:
Second-trimester screening test for trisomy 21 (Down syndrome), trisomy 18, and open neural tube defects.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
2-3 days

Notes:
This test is used to screen for fetal risk of Down syndrome (trisomy 21), trisomy 18, and Open Neural Tube Defect (ONTD, spina bifida).

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Refer to report.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

CPT Codes:
81511

Section:
RF-ARUP

Remarks:
Submit with Order: Patient's date of birth, current weight, due date, dating method (US, LMP), number of fetuses present, patient's race, if the patient was diabetic at the time of conception, if there is a known family history of neural tube defects, if the patient has had a previous pregnancy with a trisomy, if the patient is currently smoking, if the patient is taking valproic acid or carbamazepine (Tegretol), if this is a repeat sample, and the age of the egg donor if in vitro fertilization.

Notes:
This test is used to screen for fetal risk of Down syndrome (trisomy 21), trisomy 18, and Open Neural Tube Defect (ONTD, spina bifida).

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 3 mL serum to an ARUP Standard Transport Tube. (Min: 1 mL)

Patient Preparation:
Specimen must be drawn between 14 weeks, 0 days and 24 weeks, 6 days gestation. The recommended time for maternal serum screening is 16 to 18 weeks gestation.

Unacceptable Conditions:
Plasma. Hemolyzed specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 1 year (Avoid repeated freeze/thaw cycles.)

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- QUAD
- AFP 4 Marker Screen
- AFP MS4 (Quad)
- Alpha Fetoprotein, hCG, Estriol, and Inhibin

Measles (Rubeola) Antibodies, IgG and IgM

LAB801

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- rubeola antibody panel
- rubeola IgG IgM
- Rubeola serology
- LAB801-VML
- LAB801VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Refer to individual components.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- rubeola antibody panel
- rubeola IgG IgM
- Rubeola serology
- LAB801-VML
- LAB801VML

Ordering Recommendations:
Aid in the diagnosis of measles infection. Test may not be helpful in patients who have recently received an MMR vaccination.

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay/Semi-Quantitative Chemiluminescent Immunoassay

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Measles, Rubeola, Antibody IgM	0.79 AU or less

Interpretive Data:

Component	Interpretation
Measles (Rubeola) Antibody, IgG	13.4 AU/mL or less: Negative - No significant level of detectable measles (rubeola) IgG antibody. 13.5-16.4 AU/mL: Equivocal - Repeat testing in 10-14 days may be helpful. 16.5 AU/mL or greater: Positive - IgG antibody to measles (rubeola) detected, which may indicate a current or past exposure/immunization to measles (rubeola).
Measles (Rubeola) Antibody, IgM	0.79 AU or less: Negative - No significant level of IgM antibodies to measles (rubeola) virus detected. 0.80-1.20 AU: Equivocal - Repeat testing in 10-14 days may be helpful. 1.21 AU or greater: Positive - IgM antibodies to measles (rubeola) virus detected. Suggestive of current or recent infection or immunization. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection or immunization.

Mercury, Urine

LAB408

ORDERING INFO

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Synonyms:

- Hg
- HGU
- Urine Hg
- Urine mercury concentration
- LAB408-VML
- LAB408VML

SPECIMEN REQUIREMENTS

Patient Preparation:

Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician), and avoid shellfish and seafood for 48 to 72 hours. High concentrations of iodine may interfere with elemental testing. Collection of urine specimens from patients receiving iodinated or gadolinium-based contrast media should be avoided for a minimum of 72 hours post-exposure. Collection from patients with impaired kidney function should be avoided for a minimum of 14 days post-contrast media exposure.

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Specimen Preparation:

Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL)

Unacceptable Conditions:

Urine collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Acid preserved urine. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element free transport tube (with the exception of the original device).

Storage/Transport Temperature:

Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):

Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Performed:

Sun-Sat

Remarks:

Trace Elements requisition form may be required (ARUP form #32990-Barcode; #32991-No Barcode). Record total volume and collection time interval on transport tube and on test request form.

ORDERING

Synonyms:

- Hg
- HGU
- Urine Hg
- Urine mercury concentration
- LAB408-VML
- LAB408VML

Ordering Recommendations:

May be useful in the assessment of acute or chronic elemental or inorganic mercury exposure and/or in monitoring chelation therapy. For the assessment of acute exposure, Mercury, Whole Blood (0099305) is preferred.

Performed:

Sun-Sat

Methodology:

Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval		
Creatinine, Urine - per 24h	**Age**	**Male (mg/d)**	**Female (mg/d)**
	3-8 years	140-700	140-700
	9-12 years	300-1300	300-1300
	13-17 years	500-2300	400-1600
	18-50 years	1000-2500	700-1600
	51-80 years	800-2100	500-1400
	81 years and older	600-2000	400-1300
Mercury, Urine - per 24h	0.0-20.0 µg/d		
Mercury, Urine - per volume	0.0-5.0 µg/L		
Mercury, Urine - ratio to CRT	0.0-20.0 µg/g CRT		

Interpretive Data:
Urinary mercury levels predominantly reflect acute or chronic elemental or inorganic mercury exposure. Urine concentrations in unexposed individuals are typically less than 10 µg/L. 24 hour urine concentrations of 30 to 100 µg/L may be associated with subclinical neuropsychiatric symptoms and tremor while concentrations greater than 100 µg/L can be associated with overt neuropsychiatric disturbances and tremors. Urine mercury levels may be useful in monitoring chelation therapy.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Trace Elements requisition form may be required (ARUP form #32990).

ORDERING

Synonyms:

- HGB
- Hg
- Hg WB
- LAB831-VML
- LAB831VML

Ordering Recommendations:
Preferred test for the assessment of acute mercury exposure. For chronic exposure, Mercury, Urine (0025050) is preferred.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-3 days

Notes:
Mercury is volatile; concentration may decrease over time.

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 10.0 µg/L

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of blood mercury, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Blood mercury levels predominantly reflect recent exposure and are most useful in the diagnosis of acute poisoning as blood mercury concentrations rise sharply and fall quickly over several days after ingestion. Blood concentrations in unexposed individuals rarely exceed 20 µg/L. The provided reference interval relates to inorganic mercury concentrations. Dietary and non-occupational exposure to organic mercury forms may contribute to an elevated total mercury result. Clinical presentation after toxic exposure to organic mercury may include dysarthria, ataxia and constricted vision fields with mercury blood concentrations from 20 to 50 µg/L.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Metanephrines Fractionated by HPLC-MS/MS, Urine

LAB6089

ORDERING INFO

Collect:
24-hour or random urine. Refrigerate 24-hour specimen during collection.

Synonyms:

- LAB6089-VML
- LAB6089VML

SPECIMEN REQUIREMENTS

Patient Preparation:
If possible, abstain from medications for 72 hours prior to collection.

Collect:
24-hour or random urine. Refrigerate 24-hour specimen during collection.

Specimen Preparation:
Thoroughly mix entire collection (24-hour or random) in one container. Transfer a 4 mL aliquot to an ARUP standard transport tube. (Min: 2.5 mL) A pH lower than 2 can cause assay interference. Record total volume and collection time interval on transport tube and test request form.
Specimen preservation can be extended to 1 month refrigerated by performing one of the following:
Option 1: Transfer a 4 mL aliquot to an ARUP standard transport tube. (Min: 2.5 mL) Adjust pH to 2.0-4.0 with 6M HCl.
Option 2: Transfer a 4 mL aliquot to an ARUP standard transport tube containing 20 mg sulfamic acid (ARUP Supply #48098), available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787. (Min: 2.5 mL)

Unacceptable Conditions:
Specimens preserved with boric acid or acetic acid.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks (unpreserved), 1 month (preserved); Frozen: 1 month

Performed:
Sun-Sat

Components

Creatinine, Urine - per 24h

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Metanephrine, Urine - per 24h

Age	Male (µg/d)	Female (µg/d)
0-6 years	Not Applicable	Not Applicable
7-12 years	45-273	40-209
13-17 years	56-298	40-209
18 years and older	55-320	36-229

Metanephrine, Urine - ratio to CRT

Age	µg/g CRT
0-3 months	0-700
4-6 months	0-650
7-11 months	0-650
1 year	0-530
2-5 years	0-500
6-17 years	0-320
18 years and older	0-300

Normetanephrine, Urine - per 24h

Age	Male (µg/d)	Female (µg/d)
0-6 years	Not Applicable	Not Applicable
7-12 years	58-670	48-474
13-17 years	82-553	65-406
18-29 years	81-667	18 years and older: 95-650
30 years and older	114-865	Not Applicable

Normetanephrine, Urine - ratio to CRT

Age	µg/g CRT
0-3 months	0-3400
4-6 months	0-2200
7-11 months	0-1100
1 year	0-1300
2-5 years	0-610
6-17 years	0-450
18 years and older	0-400

Interpretive Data:

Smaller increases in metanephrine and/or normetanephrine concentrations (less than two times the upper reference limit) usually are the result of physiological stimuli, drugs, or improper specimen collection. Essential hypertension is often associated with slight elevations (metanephrine less than 400 ug/d and normetanephrine less than 900 ug/d). Elevated concentrations may be due to intense physical activity, life-threatening illness, and drug interferences.

Significant elevation of one or both metanephrines (three or more times the upper reference limit) is associated with an increased probability of a neuroendocrine tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

SPECIMEN REQUIREMENTS

Patient Preparation:
Drugs and medications may affect results and should be discontinued for at least 72 hours prior to specimen collection, if possible. Collection of the specimen after the patient has rested for 15 minutes in a supine position is recommended.

Collect:
Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Centrifuge within 1 hour. Transfer 2 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 1 mL) Avoid hemolysis.

Unacceptable Conditions:
Plasma separator tubes. Body fluids other than EDTA or heparinized plasma. Non-frozen specimens. Grossly hemolyzed.

Storage/Transport Temperature:
Frozen. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: 3 Days; Refrigerated: 10 Days; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Fractionated metanephrines
- Fractionated Plasma Free Metanephrines
- Free Metanephrine
- Metanephrine
- Metanephrines, Fractionated
- NMN, plasma
- Normetanephrine
- Normetanephrine, free
- Plasma Metanephrines
- Quantitative Metanephrines
- LAB3789-VML
- LAB3789VML

Ordering Recommendations:
First-line test in suspected pheochromocytoma.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-5 days

Notes:

Isoetharine, isoproterenol, 3,4-methylenedioxyamphetamine (MDA), and 3,4-methylenedioxymethamphetamine (MDMA) are known to interfere with this test.

Many drugs/medications, including over-the-counter and herbal products, can interfere with test results. Testing for all potential interactions is not possible. If the patient is taking a drug not listed as an interferent, its potential effect on test results is unknown. If test results are inconsistent with clinical evidence, drug interference should be considered. If appropriate, the patient should discontinue the potential interferent for 48-72 hours and a new sample collected for retesting.

RESULTS INTERPRETATION

Reference Interval:

Normetanephrine: 0.0-0.89 nmol/L
Metanephrine: 0.0-0.49 nmol/L

Interpretive Data:

This test is useful in the detection of pheochromocytoma, a rare neuroendocrine tumor. The majority of patients with pheochromocytoma have a plasma normetanephrine concentration in excess of 2.2 nmol/L and/or a metanephrine concentration in excess of 1.1 nmol/L. Increased concentrations of these analytes serve as confirmation for diagnosis. Patients with essential hypertension and plasma concentrations of normetanephrine below 0.9 nmol/L and a metanephrine concentration below 0.5 nmol/L, can be excluded from further testing. If clinical suspicion remains, repeat testing or testing for metanephrines in a 24-hr. urine specimen should be considered.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Collect:

Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:

Centrifuge within 1 hour. Transfer 2 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 1 mL) Avoid hemolysis.

Patient Preparation:

Drugs and medications may affect results and should be discontinued for at least 72 hours prior to specimen collection, if possible. Collection of the specimen after the patient has rested for 15 minutes in a supine position is recommended.

Unacceptable Conditions:

Plasma separator tubes. Body fluids other than EDTA or heparinized plasma. Non-frozen specimens. Grossly hemolyzed.

Stability (from collection to initiation):

After separation from cells: Ambient: 3 Days; Refrigerated: 10 Days; Frozen: 1 month

Storage/Transport Temperature:

Methadone and Metabolite, Urine, Quantitative

LAB6103

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Pain Management
- EDDP
- Dolophine
- Physeptone
- Symoron
- Amidone
- Heptadon
- Methadone
- Methadose
- LAB6103-VML
- LAB6103VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 1 mL with no additives or preservatives urine to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Performed:
Sun-Sat

ORDERING

Synonyms:

- Pain Management
- EDDP
- Dolophine
- Physeptone
- Symoron
- Amidone
- Heptadon
- Methadone
- Methadose
- LAB6103-VML
- LAB6103VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Methadone Urine Screen with Reflex to Quantitation (2012245).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

Notes:
Compare to Pain Management, Methadone, Quantitative, with medMATCH, Urine; Pain Management, Methadone, with Confirmation with medMATCH, Urine.

RESULTS INTERPRETATION

Reference Interval:

Drugs Covered	Cutoff Concentrations
Methadone	100 ng/mL
EDDP	100 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 100 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Methanol, plasma

LAB3471

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- LAB3471, MTH, Wood Alcohol
- LAB3471-VML
- LAB3471VML

Turn Around Time:
6 hours after sample received in lab

SPECIMEN REQUIREMENTS

Patient Preparation:
A non-alcohol based cleanser should be used to clean the venipuncture site prior to collection.

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Specimens should be delivered to the lab immediately and should be centrifuged and separated within 2 hours of collection. (Minimum 0.5 mL plasma)

Pediatric Collection:
Dark green microtainer (Sodium heparin)

Storage/Transport Temperature:
Refrigerated (2-8°C) if not delivered to the lab immediately

Performed:
Daily

Stability:
After separation from cells: Refrigerated (2-8°C): 7 days

Specimen:
Plasma

Alternate Specimen:
Gray tube (Sodium fluoride) or red tube (no gel)

ORDERING

Ordering Indicators:
This test is used in the confirmation of methanol toxicity.

Synonyms:

ORDERING INFO

Collect:
Plain red or serum separator tube. Also acceptable: Green (sodium heparin), green (lithium heparin), lavender (EDTA), or pink (K_2EDTA).

Synonyms:

- Cobalamin Deficiency (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- MMA (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- Methylmalonate (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- Vitamin B12 Deficiency (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- LAB3793-VML
- LAB3793VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube. Also acceptable: Green (sodium heparin), green (lithium heparin), lavender (EDTA), or pink (K_2EDTA).

Specimen Preparation:
Centrifuge and remove serum or plasma from cells within 2 hours of collection. Transfer 1.2 mL serum or plasma to an ARUP Standard Transport Tube and refrigerate or freeze immediately. (Min: 0.6 mL)

Unacceptable Conditions:
Room temperature specimens. Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Cobalamin Deficiency (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- MMA (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- Methylmalonate (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- Vitamin B12 Deficiency (Methylmalonic Acid, Serum or Plasma (Vitamin B12 Deficiency))
- LAB3793-VML
- LAB3793VML

Ordering Recommendations:
Use to evaluate vitamin B12 deficiency in individuals with macrocytic or unexplained anemia, or unexplained neurologic disease. Preferred test is Vitamin B12 with Reflex to Methylmalonic Acid, Serum (Vitamin B12 Status) (0055662).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
0.00-0.40 µmol/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Mexiletine, Serum or Plasma

LAB3792

ORDERING INFO

Collect:
Serum Pre-dose (Trough) Draw - At a Steady State Concentration or Plasma Pre-dose (Trough) Draw - At a Steady State Concentration in Plain Red, Lavender (K_2EDTA), Lavender (K_3EDTA), or Pink (K_2EDTA).

Synonyms:

- Mexitil blood level
- Mexitil
- LAB3792-VML
- LAB3792VML

SPECIMEN REQUIREMENTS

Collect:
Serum Pre-dose (Trough) Draw - At a Steady State Concentration or Plasma Pre-dose (Trough) Draw - At a Steady State Concentration in Plain Red, Lavender (K_2EDTA), Lavender (K_3EDTA), or Pink (K_2EDTA).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel Separator Tubes, Light Blue (Sodium Citrate), or Yellow (SPS or ACD Solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 5 days; Frozen: 2 months

Performed:
Mon, Thu, Sat

ORDERING

Synonyms:

- Mexitil blood level
- Mexitil
- LAB3792-VML
- LAB3792VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Mon, Thu, Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 12, 2018

Therapeutic Range	0.5-2.0 µg/mL
Toxic Level	Greater than 2.0 µg/mL

Interpretive Data:
The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Toxic concentrations may cause hypotension, tremor and cardiac abnormalities.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Microsatellite Instability (MSI), Tissue

LAB5660

ORDERING INFO

Collect:
N/A

Synonyms:

- LAB5660, MSI
- LAB5660-VML
- LAB5660VML

Turn Around Time:
10 days

SPECIMEN REQUIREMENTS

Patient Preparation:
Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:
N/A

Specimen Preparation:
Curls and unstained slides should be cut 10 micron thick with two accompanying H&E stained slides cut before and after unstained slides or curls. Tissue blocks will be returned after testing.

Pediatric Collection:
N/A

Storage/Transport Temperature:
Paraffin block: Ambient (15-25°C); EDTA: Ambient (15-25°C) or Refrigerated (2-8°C)

Performed:
Once per week - variable days

Stability:
Paraffin block: indefinitely; EDTA tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days

Specimen:
Tumor sample: Paraffin embedded tissue; Normal (control) sample: Paraffin embedded tissue or whole blood.

Alternate Specimen:
Peripheral blood in a lavender tube (EDTA) may be submitted as a normal sample if normal uninvolved tissue is not available.

ORDERING

Ordering Indicators:
Consideration of immunotherapy in cancer and during evaluation for Lynch syndrome.

Synonyms:

- LAB5660, MSI
- LAB5660-VML
- LAB5660VML

Performed:
Once per week - variable days

Turn Around Time:
10 days

Methodology:
PCR amplification of matching normal and tumor samples followed by capillary electrophoresis allows for comparison of allelic profiles of 5 mononucleotide microsatellite markers.

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Microsatellite Stable: MSI not detected. MSI Low: <30% of loci tested show MSI. MSI High: >=30% of loci tested show MSI.

Interpretive Data:
Alleles present in the tumor sample that are not found in the corresponding normal sample indicate microsatellite instability. Colon samples found to have high microsatellite instability (MSI-H) will be reflexed for BRAF c.1799T>A testing per institutional protocol.

Methodology:
PCR amplification of matching normal and tumor samples followed by capillary electrophoresis allows for comparison of allelic profiles of 5 mononucleotide microsatellite markers.

MISCELLANEOUS CYTOLOGY

ORDERING INFO

Collect:
Clean glass slide and coplin jar with 95% alcohol (provided by the Cytopathology lab)

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean glass slide and coplin jar with 95% alcohol (provided by the Cytopathology lab)

Specimen Preparation:
1. The specimen is collected on clean, labeled glass slides, and immediately placed into a coplin jar filled with 95% alcohol. 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Coplin jar is labeled with a lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: 2 glass slides)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C).

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) 6 weeks

Specimen:
Lesion scraping on clean, labeled glass slide in 95% ethanol.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
MUST PROVIDE BODY SITE, need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc.

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
Pap stain.

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
Detection and characterization of inflammatory/infectious processes of the skin, especially herpetic infections.

Methodology:
Pap stain.

Miscellanous Coagulation

LAB6318

ORDERING INFO

Collect:

Four 2.7 mL Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB6318, Misc Coag
- LAB6318-VML
- LAB6318VML

Turn Around Time:

1 - 7 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:
Four 2.7 mL Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:
Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, double centrifugation is required. Transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:
Pediatric: Three 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: Three 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:
Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:
By request only

Stability:
Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:
Citrated platelet poor plasma.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:

Mitochondrial M2 Antibody, IgG (ELISA)

LAB724

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Antibodies to Microtubule Associated Protein 2
- Antimitochondrial Antibodies
- Immunology Profile (AMA)
- Mitochondrial Antibodies, Serum
- AMA
- Anti-Mitochondrial Antibody
- LAB724-VML
- LAB724VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL to an ARUP standard transport tube. (Min: 0.3 mL)

Unacceptable Conditions:
Plasma. Contaminated, hemolyzed, grossly icteric, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Antibodies to Microtubule Associated Protein 2
- Antimitochondrial Antibodies
- Immunology Profile (AMA)
- Mitochondrial Antibodies, Serum
- AMA
- Anti-Mitochondrial Antibody
- LAB724-VML
- LAB724VML

Ordering Recommendations:
May be useful in confirming a diagnosis of primary biliary cholangitis.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-2 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Mitochondrial (M2) Antibody, IgG	24.9 Units or less

Interpretive Data:

Antimitochondrial antibodies (AMA) are thought to be present in 90-95% of patients with primary biliary cholangitis (PBC). However, the frequency of detected antibodies may be cohort or assay dependent, as lower sensitivities have been reported. Not all PBC patients are positive for AMA; some patients may be positive for SP100 and/or GP210 antibodies. A negative result does not rule out PBC.

Component	Interpretation
Mitochondrial M2 Antibody, IgG (ELISA)	20.0 Units or less Negative 20.1-24.9 Equivocal 25.0 Units or greater Positive

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Plasma. Contaminated, hemolyzed, grossly icteric, or severely lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- Antibodies to Microtubule Associated Protein 2
- Antimitochondrial Antibodies
- Immunology Profile (AMA)
- Mitochondrial Antibodies, Serum
- AMA
- Anti-Mitochondrial Antibody
- LAB724-VML
- LAB724VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-2 days

Ordering Recommendations:

May be useful in confirming a diagnosis of primary biliary cholangitis.

Interpretive Data:

Antimitochondrial antibodies (AMA) are thought to be present in 90-95% of patients with primary biliary cholangitis (PBC). However, the frequency of detected antibodies may be cohort or assay dependent, as lower sensitivities have been reported. Not all PBC patients are positive for AMA; some patients may be positive for SP100 and/or GP210 antibodies. A negative result does not rule out PBC.

Component	Interpretation
Mitochondrial M2 Antibody, IgG (ELISA)	20.0 Units or less Negative 20.1-24.9 Equivocal 25.0 Units or greater Positive

Reference Interval:

Components	Reference Interval
Mitochondrial (M2) Antibody, IgG	24.9 Units or less

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Monospot, serum or plasma

LAB482

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB482, MON
- LAB482-VML
- LAB482VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 24 hours

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Yellow tube (ACD)

ORDERING

Ordering Indicators:
This test is used to be used as an aid in diagnosing primary Epstein-Barr (EBV) infectious mononucleosis.

Synonyms:

- LAB482, MON
- LAB482-VML
- LAB482VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Hemagglutination with color enhancement

Components:
Mono Screen

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result is suggestive of primary infection with EBV.

Methodology:
Hemagglutination with color enhancement

MPL Exon 10 Mutation Analysis, Whole blood, bone marrow

LAB6146

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB6146, MPL
- LAB6146-VML
- LAB6146VML

Turn Around Time:

14 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

Two Lavender microtainers (EDTA) or bone marrow

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Variable

Stability:

EDTA and ACD-A: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C

Specimen:

Blood, bone marrow, purified DNA

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

MPL mutations are found in roughly 8% and 4% of cases of primary myelofibrosis (PMF) and essential thrombocythemia (ET), respectively. Given the heterogeneity of MPL variants within exon 10, Sanger sequencing of this exon is justified in patients suspected of having a JAK2 and CALR mutation negative clonal MPN.

Synonyms:

- LAB6146, MPL
- LAB6146-VML
- LAB6146VML

Performed:

Variable

Turn Around Time:
14 days

Methodology:
PCR coupled with Sanger sequencing and capillary electrophoresis

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This assay will detect the presence of sequence variants in exon 10 of MPL with a sensitivity of roughly 10-15%.

Methodology:
PCR coupled with Sanger sequencing and capillary electrophoresis

Multiple Myeloma Oncogene-1 (MRQ-43) Immunohistochemical Stain, Formalin FIxed Paraffin Embedded Tissue

CoPath163

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- MUM1

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Ordering Indicators:
N/A

Synonyms:

- MUM1

Performed:
Monday-Friday

Turn Around Time:
2 Days

Methodology:
Immunohistochemical Stain

Components:
Stained slide and control

RESULTS INTERPRETATION

Reference Interval:
N/A

Interpretive Data:
N/A

Methodology:
Immunohistochemical Stain

ADDITIONAL INFORMATION

Section:
Histology

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Additional Information:
Complete VPLS Test Requisition. Request special requisition form No 60-002-664 if ordering on a regular basis. Package slides in durable slide holder and place with any block in padded envelope to protect from breaking.

Components:
Stained slide and control

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Mumps Virus Antibody, IgM

LAB161

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- MMR
- Mumps IgM
- Mumps IgM Antibody, IFA (Serum)
- Mumps Serology
- LAB161-VML
- LAB161VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon-Fri

ORDERING

Synonyms:

- MMR
- Mumps IgM
- Mumps IgM Antibody, IFA (Serum)
- Mumps Serology
- LAB161-VML
- LAB161VML

Ordering Recommendations:
Aid in the diagnosis of suspected mumps infection.

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
0.79 IV or less: Negative - No significant level of detectable IgM antibody to Mumps virus.
0.80-1.20 IV: Equivocal - Borderline levels of IgM antibody to Mumps virus. Repeat testing in 10-14 days may be helpful.
1.21 IV or greater: Positive - Presence of IgM antibody to Mumps virus detected, which may indicate a current or recent infection. However, low levels of IgM antibody may occasionally persist for more than 12 months post-infection or immunization.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Mumps Virus IgG, Serum

LAB160

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB160, MUM, Mumps IgG Antibody
- LAB160-VML
- LAB160VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 9 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is intended to be used as an aid in the determination of serological status to mumps virus or mumps vaccination.

Synonyms:

- LAB160, MUM, Mumps IgG Antibody
- LAB160-VML
- LAB160VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Chemiluminescent Immunoassay

Components:
Mumps IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A negative result indicates that the patient has not been exposed/immunized to mumps virus. A positive result indicates current or past exposure/immunization to mumps virus.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Mycobacterium tuberculosis complex and rifampin resistance detection by PCR

LAB6273

ORDERING INFO

Collect:
Sterile screwtop container

Synonyms:

- TB PCR, MTB/RIF, GeneXpert, TB PCR w/RIF
- LAB6273-VML
- LAB6273VML

Turn Around Time:
24 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Sterile screwtop container

Specimen Preparation:
(Min, 1 mL)

Pediatric Collection:
Gastric aspirates acceptable

Storage/Transport Temperature:
Ambient: (15-25°C) (Refrigerated: (2-8°C)

Performed:
Daily

Stability:
Send to laboratory immediately. Ambient: (15-25°C) 4 hours. Refrigerated: (2-8°C) 7 days.

Specimen:
Sputum

Alternate Specimen:
Endotracheal aspriate, brochoalveolar lavage, pleural fluid, peritoneal fluid, abscess, CSF, lymph node, tissue, vitreous fluid, urine

ORDERING

Ordering Indicators:
Assessment of tuberculosis. Must submit with Culture, Acid Fast Bacillus

Synonyms:

- TB PCR, MTB/RIF, GeneXpert, TB PCR w/RIF
- LAB6273-VML
- LAB6273VML

Performed:
Daily

Turn Around Time:
24 hours

Methodology:
Real Time PCR

Components:
Detection of Mycobacterium tuberculosis complex and rifampin resistance by PCR

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
Sensitivity of this test is ~70% in smear-negative specimens. Culture must always be performed in conjunction to assess for non-tuberculous mycobacteria and/or infections below the limit of detection by RT-PCR.

Methodology:
Real Time PCR

ADDITIONAL INFORMATION

Mycophenolic Acid and Metabolites

LAB3794

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K2 or K_3EDTA) or pink (K_2EDTA).

Synonyms:

- Cellcept
- CellCept MPA
- Myfortic
- LAB3794-VML
- LAB3794VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K2 or K_3EDTA) or pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.1 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 6 weeks; Refrigerated: 6 weeks; Frozen: 11 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Cellcept
- CellCept MPA
- Myfortic
- LAB3794-VML
- LAB3794VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Component	Therapeutic Range	Toxic
Mycophenolic Acid	1.0 - 3.5 µg/mL	Greater than 25.0 µg/mL
Mycophenolic Acid Glucuronide	35.0-100.0 µg/mL	Not well established

Interpretive Data:

The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. A proposed therapeutic range is 1.0-3.5 µg/mL for a 2 g/day dose. A 3 g/day dose may have plasma concentrations up to 5.0 µg/mL. Trough concentrations between 2.0 and 4.0 µg/mL have been suggested to maximize efficacy and minimize adverse effects. Mycophenolic acid glucuronide is an inactive metabolite and a range of 35.0-100.0 µg/mL indicates normal metabolism. During the first two weeks of transplantation, mycophenolic acid glucuronide concentrations are typically 100 - 250 µg/mL. Adverse effects of toxicity include abdominal pain, peripheral edema, cardiac abnormalities, hypertension and electrolyte disturbances.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

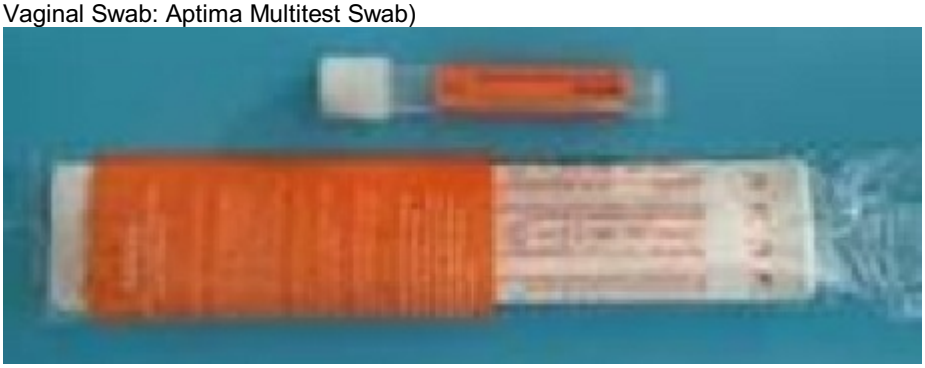
Mycoplasma Genitalium by TMA

LAB6084

ORDERING INFO

Collect:

Vaginal Swab: Aptima Multitest Swab)



Synonyms:

- LAB6084, Mycoplasma genitalium, PCR, Wet Prep, Vaginitis
- LAB6084-VML
- LAB6084VML

Turn Around Time:

72 Hours

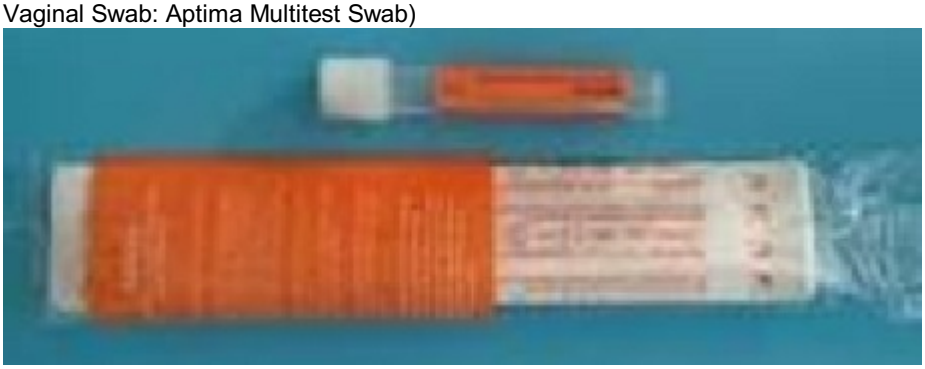
SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Vaginal Swab: Aptima Multitest Swab)



Specimen Preparation:

Swab: Place swab in Swab Specimen Transport Tube, break shaft off at scoreline then recap tube. Urine: Transfer 2 mL urine within 24 hours to Aptima Urine Specimen Transport Tube. Liquid level must be between fill lines on tube. (Min 1mL urine)

Pediatric Collection:

Performance of the assay has not been evaluated in individuals less than 15 years of age.

Storage/Transport Temperature:

Ambient (15-25°C)

Performed:

Monday

Stability:

Ambient (15-25°C): 30 days

Specimen:

ThinPrep, Vaginal/Cervical Swabs, Urethral Swab, Urine

Alternate Specimen:

Male urethral swab: Aptima Unisex Swab Collection Kit (White Tube)

ORDERING

Ordering Indicators:

Therapeutic failure or success cannot be determined with the Aptima Mycoplasma genitalium assay since nucleic acid may persist following appropriate antimicrobial therapy.

Synonyms:

MYD88 (L265P) Mutation Analysis, Whole blood, bone marrow

LAB5710

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB5710, M88
- LAB5710-VML
- LAB5710VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Curls and unstained slides should be cut 10 micron thick with two accompanying H&E stained slides cut before and after unstained slides or curls. Tissue blocks will be returned after testing.

Pediatric Collection:

Two Lavender microtainers (EDTA)

Storage/Transport Temperature:

EDTA and ACD-A tubes: Ambient (15-25°C) or Refrigerated (2-8°C); paraffin block: Ambient (15-25°C); purified DNA: Refrigerated (2-8°C) or Frozen (-20°C)

Performed:

Once per week - variable days

Stability:

EDTA and ACD-A tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Paraffin block: indefinitely; Purified DNA: indefinitely at -70°C.

Specimen:

Blood, bone marrow, paraffin embedded tissue, purified DNA

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

Clinical suspicion/laboratory evidence of plasma cell neoplasia or Waldenstr&oumlm macroglobulinemia.

Synonyms:

- LAB5710, M88
- LAB5710-VML
- LAB5710VML

Performed:

Once per week - variable days

Turn Around Time:
10 days

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of MYD88 c.794T>C (p.L265P); Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This assay will detect the presence of the c.794T>C (p.L265P) allele of MYD88 with a sensitivity of approximately 3%.

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of MYD88 c.794T>C (p.L265P); Laboratory Developed Test

Serum separator tube.

Synonyms:

- MAG and SGPG Antibodies
- MAG Dual Antigen
- MAG IgM
- Myelin Assoc. Glycoprotein (MAG) Antibody w/Reflex to MAG-SGPG & MAG, EIA
- MAG Antibody Dual ELISA
- SGPG IgM
- SGPG MAG Ab
- LAB3784-VML
- LAB3784VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL)

Unacceptable Conditions:
Urine. Contaminated, heat-inactivated, hemolyzed, icteric, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Tue

ORDERING

Synonyms:

- MAG and SGPG Antibodies
- MAG Dual Antigen
- MAG IgM
- Myelin Assoc. Glycoprotein (MAG) Antibody w/Reflex to MAG-SGPG & MAG, EIA
- MAG Antibody Dual ELISA
- SGPG IgM
- SGPG MAG Ab
- LAB3784-VML
- LAB3784VML

Ordering Recommendations:
May be useful in testing for autoimmune neuropathies. Test by itself is not diagnostic and should be used in conjunction with other clinical parameters to confirm disease.

Performed:
Tue

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
MAG Antibody, IgM Elisa	Less than 1000 TU
SGPG Antibody, IgM	Less than 1.00 IV

Interpretive Data:

An elevated IgM antibody concentration greater than 999 TU against myelin-associated glycoprotein (MAG) suggests active demyelination in peripheral neuropathy. A normal concentration (less than 999 TU) generally rules out an anti-MAG antibody-associated peripheral neuropathy.

The majority of sulfate-3-glucuronyl paragloboside (SGPG) IgM-positive sera will show reactivity against MAG. Patients who are SGPG IgM positive and MAG IgM negative may have multi-focal motor neuropathy with conduction block.

TU=Titer Units

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Myelin Basic Protein

LAB190

ORDERING INFO

Collect:
CSF.

Synonyms:

- MBP
- LAB190-VML
- LAB190VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transport 1 mL CSF. (Min: 0.3 mL) Avoid hemolysis. If CSF is bloody, centrifuge the sample and separate supernatant from cells prior to freezing the sample.

Unacceptable Conditions:
Hemolysis.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 3 weeks (Avoid freeze/thaw cycles)

Performed:
Sun-Sat

Remarks:
CSF should be free from contamination with blood. Hemolysis is associated with falsely-elevated levels of MBP.

ORDERING

Synonyms:

- MBP
- LAB190-VML
- LAB190VML

Ordering Recommendations:
Not recommended for the workup of suspected multiple sclerosis. Preferred test is Oligoclonal Band Profile (0080440).

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
0.00-5.50 ng/mL

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Myeloid NGS Panel, Whole blood, bone marrow

LAB6270

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- MDL Myeloid NGS Panel, Next Generation Sequencing
- LAB6270-VML
- LAB6270VML

Turn Around Time:

14 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Variable

Stability:

EDTA: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C

Specimen:

Blood, bone marrow, purified DNA

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Clinical suspicion/laboratory evidence of a myeloid malignancy

Synonyms:

- MDL Myeloid NGS Panel, Next Generation Sequencing
- LAB6270-VML
- LAB6270VML

Performed:

Variable

Turn Around Time:

14 days

Methodology:
Next Generation Sequencing

Components:
ABL1, ANKRD26, ASXL1, BCOR, BCORL1, BRAF, CALR, CBL, CEBPA, CSF3R, CUX1, DDX41, DHX15, DNMT3A, ETV6, EZH2, FBXW7, FLT3, GATA1, GATA2, HRAS, IDH1, IDH2, JAK2, KIT, KRAS, LUC7L2, MPL, NF1, NOTCH1, NPM1, NRAS, PHF6, PTEN, PTPN11, RAD21, RUNX1, SETBP1, SF3B1, SH2B3, SMC1A, SMC3, SRSF2, STAG2, TET2, TP53, U2AF1, WT1, XPO1, ZRSR2

RESULTS INTERPRETATION

Reference Interval:
Normal

Interpretive Data:
This assay will detect the presence of sequence variants associated with myeloid malignancies with a sensitivity of 4% for single nucleotide variants, 3% for small insertions, deletions, and/or duplications, and 1% for certain hotspot mutations.

Methodology:
Next Generation Sequencing

ADDITIONAL INFORMATION

Myeloperoxidase (MPO) IgG, serum

LAB3464

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB3464, MPO, Myeloperoxidase Antibody, Anti-MPO
- LAB3464-VML
- LAB3464VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used to evaluate patients with signs and symptoms of ANCA-associated vasculitis.

Synonyms:

- LAB3464, MPO, Myeloperoxidase Antibody, Anti-MPO
- LAB3464-VML
- LAB3464VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
MPO IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result of MPO has high positive predictive value of microscopic polyangiitis (MPA) in patients with negative test results for systemic lupus erythematosus (antinuclear antibodies) and Goodpasture syndrome (glomerular basement membrane antibody). A negative result significantly diminishes the likelihood that a patient has MPA.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Additional Information:
Anti-MPO is included in the ANCA test panel. It should not be ordered alone unless the patient previously tested positive for anti-MPO.

Components:
MPO IgG

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

- Serum myoglobin
- LAB105-VML
- LAB105VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube. Also acceptable: Green (lithium heparin), lavender (K_3EDTA or K_2EDTA) or pink (K_2EDTA).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Grossly hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 days; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Serum myoglobin
- LAB105-VML
- LAB105VML

Ordering Recommendations:
Not a standalone test. Troponin testing is recommended for diagnosis and management of acute coronary syndrome; refer to Troponin T (cTnT) 5th Generation (3001831).

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
Effective February 22, 2022
Male: less than or equal to 72 ng/mL
Female: less than or equal to 58 ng/mL

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Myoglobin, Urine

LAB3238

ORDERING INFO

Collect:
Random or 24-hour urine. Refrigerate during collection.

Synonyms:

- Urine myoglobin
- LAB3238-VML
- LAB3238VML

SPECIMEN REQUIREMENTS

Collect:
Random or 24-hour urine. Refrigerate during collection.

Specimen Preparation:
Thoroughly mix entire collection, then, perform one of the two processing options below:
Option 1: Immediately after collection, adjust pH to 8-9 by adding 10 percent Na2CO3. Transfer 1 mL aliquot urine to an ARUP Standard Transport Tube. (Min: 0.5 mL)
Option 2: Immediately after collection, transfer a maximum of 4 mL urine to an ARUP Standard Transport Tube prefilled with Sodium Carbonate (ARUP)supply #48096). (Min: 0.5 mL) Available online through eSupply using ARUP Connect or contact ARUP Client Services at (800) 522-2787.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
pH 8-9: Ambient: 4 hours; Refrigerated: 72 hours; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Urine myoglobin
- LAB3238-VML
- LAB3238VML

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
0-1 mg/L

Interpretive Data:
Patients with urine myoglobin greater than 15 mg/L are at risk of acute renal failure. Usual results are less than 1 mg/L. Results between 1 and 15 mg/L are associated with vigorous exercise, myocardial infarct, mild muscle injury, and other conditions.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Nasal Staphylococcus aureus Colonization by PCR

LAB6192

ORDERING INFO

Collect:
Nasal Swab: Eswab

Synonyms:

- LAB6192, Staph Nasal PCR, Staph Nasal Screen, NSA, MRSA
- LAB6192-VML
- LAB6192VML

Turn Around Time:
24 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Nasal Swab: Eswab

Specimen Preparation:
Swab: Place swab in eSwab Specimen Transport Tube, break shaft off at scoreline then recap tube. (Min 0.3mL eSwab)

Pediatric Collection:
Nasal Swab: Eswab

Storage/Transport Temperature:
Ambient (15-25°C)

Performed:
Daily

Stability:
Ambient (15-25°C): 24 hours; Refrigerated: 5 days

Specimen:
Nasal Swab (eSwab)

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
The Cepheid Xpert SA Nasal Complete Assay is a qualitative diagnostic test designed for rapid detection of Staphylococcus aureus (SA) and methicillin-resistant Staphylococcus aureus (MRSA) from nasal swabs in patients at risk for nasal colonization. The test utilizes automated real-time polymerase chain reaction (PCR) to detect MRSA/SA DNA. The assay is intended to aid in the prevention and control of MRSA/SA infections.

Synonyms:

- LAB6192, Staph Nasal PCR, Staph Nasal Screen, NSA, MRSA
- LAB6192-VML
- LAB6192VML

Performed:
Daily

Turn Around Time:
24 hours

Methodology:
PCR-Polymerase Chain Reaction

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
The assay is intended to aid in the prevention and control of MRSA/SA infections. The assay is not intended to diagnose, guide or monitor treatment for MRSA/SA infections, or provide results of susceptibility to methicillin. A negative result does not preclude MRSA/SA nasal colonization. Concomitant cultures are necessary to recover organisms for epidemiological typing or for further susceptibility testing.

Methodology:
PCR-Polymerase Chain Reaction

Natalizumab Antibodies

LAB3797

ORDERING INFO

Collect:
Plain red. Also acceptable: Serum separator tube (SST).

Synonyms:

- Tysabri Neutralizing Antibody
- Tysabri, Natalizumab Immunogenicity Test
- LAB3797-VML
- LAB3797VML

SPECIMEN REQUIREMENTS

Collect:
Plain red. Also acceptable: Serum separator tube (SST).

Specimen Preparation:
Allow blood to clot at room temperature for 30 minutes. Separate serum from cells within 1 hour. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Storage/Transport Temperature:
Frozen. Also acceptable: Refrigerated

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 Weeks; Frozen: 2 Weeks

Performed:
Varies

ORDERING

Neisseria gonorrhoeae Culture

LAB1382

ORDERING INFO

Collect:

Aspirate fluid: transfer to sterile, screwtop container.

Synonyms:

- GC, Neisseria culture, gonorrhea culture, AGC
- LAB1382-VML
- LAB1382VML

Turn Around Time:

1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Aspirate fluid: transfer to sterile, screwtop container.

Specimen Preparation:
When swabs are collected, use flocked swabs in liquid Amies transport media (e.g., Eswab). For cervical specimens, moisten speculum with warm water, not lubricants, which can be antibacterial. Collect aspirates in sterile container. Do not refrigerate. (Min: 1 swab or 0.5 mL fluid)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Submit to laboratory immediately. Ambient: (15-25°C) 6 hours

Specimen:
Vaginal, cervical, male urethral, throat, eye and rectal

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Nucleic acid testing is preferred for testing due to increased sensitivity for the detection of Neisseria gonorrhoeae. Refer to MIDL PCR Chlamydia trachomatis/Neisseria gonorrhoeae (LAB 1364)

Synonyms:

- GC, Neisseria culture, gonorrhea culture, AGC
- LAB1382-VML
- LAB1382VML

Performed:
Daily

Turn Around Time:
1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

Methodology:
Aerobic culture

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Negative for Neisseria gonorrhoeae

Interpretive Data:
Antimicrobial susceptibility testing available on request. A positive culture indicates infection with N. gonorrhoeae. Because of the labile nature of the organism, a negative culture does not rule out infection.

Methodology:
Aerobic culture

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
N/A

Additional Information:
Identification tests are billed separetly from culture.

Neurofilament (2F11) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath169

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- N/A

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Ordering Indicators:
N/A

Synonyms:

- N/A

Performed:
Monday-Friday

Turn Around Time:
2 Days

Methodology:
Immunohistochemical Stain

Components:
Stained slide and control

RESULTS INTERPRETATION

Reference Interval:
N/A

Interpretive Data:
N/A

Methodology:
Immunohistochemical Stain

ADDITIONAL INFORMATION

Section:
Histology

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Additional Information:
Complete VPLS Test Requisition. Request special requisition form No 60-002-664 if ordering on a regular basis. Package slides in durable slide holder and place with any block in padded envelope to protect from breaking.

Components:
Stained slide and control

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)
