Neuromuscular NGS Panel, Blood Saliva DNA

ORDERING INFO

Collect:
Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Synonyms:

- Neuromuscular NGS Panel, Next Generation Sequencing

Turn Around Time:
40 Business Days From Financial Clearance

SPECIMEN REQUIREMENTS

Patient Preparation:
Saliva: Patient Must Follow Kit Instructions

Collect:
Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Specimen Preparation:
Extracted DNA should be sent in a screw cap tube with at least 2 micrograms - 5 micrograms of purified DNA at a concentration of at least 20 ng/ul - 50 ng/uL. Indicate patient's name, date of birth, and concentration on tube label. (Minimum Volume: 2 micrograms for limited specimens)

Storage/Transport Temperature:
Blood: Ambient (15-25°C), Saliva: Ambient (15-25°C), DNA Ambient (15-25°C)

Performed:
Weekly

Stability:
Blood Ambient (15-25°C): 72 Hours, Saliva Ambient (15-25°C): 2 weeks, DNA Ambient (15-25°C): 48 Hours

Specimen:
N/A

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Preferred test to determine genetic causes for individuals with suspected hereditary neuromuscular conditions or a family history of neuromuscular disease.

Synonyms:

- Neuromuscular NGS Panel, Next Generation Sequencing

Performed:
Weekly

Turn Around Time:
40 Business Days From Financial Clearance

Methodology:
Next Generation Sequencing

Components:
Sequence and del/dup analysis of coding exons for genes associated with neuromuscular disorders

Neuron Specific Enolase, Serum

LAB6343

ORDERING INFO

Collect:
Serum Separator Tube (SST). Also acceptable: Plain Red.

Synonyms:

- LAB6343-VML
- LAB6343VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST). Also acceptable: Plain Red.

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- LAB6343-VML
- LAB6343VML

Ordering Recommendations:
Use to detect neuron specific enolase, which may be a tumor marker for evaluation of neuroendocrine tumors.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Immunoassay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 12.7 ng/mL

Interpretive Data:
This assay is performed using the BRAHMS NSE Kryptor Immunoassay. Results obtained with different assay methods or kits cannot be used interchangeably. Results cannot be interpreted as absolute evidence of the presence or absence of malignant disease.

Methodology:
Quantitative Immunoassay

Neuronal Nuclear Antibodies (Hu, Ri, Yo, Tr/DNER) IgG by Immunoblot, Serum

LAB6160

ORDERING INFO

Collect:
Serum separator tube

Synonyms:

- PCA-3
- Tr
- DNER
- Hu, Ri, Yo, and Tr/DNER Ab
- Hu; Ri; Yo; Tr/DNER
- Neuronal Ab Immunoblot
- Neuronal Nuclear Ab IgG
- Paraneoplastic
- Hu
- Ri
- Yo
- Tr/DNER
- LAB6160-VML
- LAB6160VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.30 mL)

Unacceptable Conditions:
Plasma. Contaminated, heat-inactivated, grossly hemolyzed, or lipemic specimens

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Mon, Thu, Sat

ORDERING

Synonyms:

- PCA-3
- Tr
- DNER
- Hu, Ri, Yo, and Tr/DNER Ab
- Hu; Ri; Yo; Tr/DNER
- Neuronal Ab Immunoblot
- Neuronal Nuclear Ab IgG
- Paraneoplastic
- Hu
- Ri
- Yo
- Tr/DNER
- LAB6160-VML
- LAB6160VML

Ordering Recommendations:
Useful for the evaluation of classic paraneoplastic neurologic syndrome.

Performed:
Mon, Thu, Sat

Methodology:
Qualitative Immunoblot

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Neuronal Nuclear Ab (Yo) IgG, IB, Serum	Negative
Neuronal Nuclear Ab (TR/DNER) IgG, IB	Negative
Neuronal Nuclear Ab (Ri) IgG, IB, Serum	Negative
Neuronal Nuclear Ab (Hu) IgG, IB, Serum	Negative

Interpretive Data:

This test detects IgG antineuronal antibodies to Hu, Ri, Yo and Tr (DNER) antigens.

Antineuronal antibodies serve as markers that aid in discriminating between a true paraneoplastic neurological disorder (PND) and other inflammatory disorders of the nervous system. Anti-Hu (antineuronal nuclear antibody, type I) is associated with small cell lung cancer. Anti-Ri (antineuronal nuclear antibody, type II) is associated with neuroblastoma in children and with fallopian tube and breast cancer in adults. Anti-Yo (anti-Purkinje cell cytoplasmic antibody) is associated with ovarian and breast cancer. Anti-Tr(DNER) is associated with Hodgkin's lymphoma.

The presence of one or more of these antineuronal antibodies supports a clinical diagnosis of PND and should lead to a focused search for the underlying neoplasm

Neutrophil Oxidative Burst Assay (DHR)

LAB3801

ORDERING INFO

Collect:
Green (Sodium or Lithium Heparin) (patient) AND Green (Sodium or Lithium Heparin) (control). Patient and control specimens must be collected within 48 hours of test performance.

Synonyms:

- CGD Test
- Chronic Granulomatous Disease Test
- DHR test
- Neutrophil Oxidation
- LAB3801-VML
- LAB3801VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect control specimen from a healthy individual unrelated to patient at approximately the same time as and under similar conditions to the patient.

Collect:
Green (Sodium or Lithium Heparin) (patient) AND Green (Sodium or Lithium Heparin) (control). Patient and control specimens must be collected within 48 hours of test performance.

Specimen Preparation:
Transport 3 mL whole blood (patient) AND 3 mL whole blood (control) in original collection tubes. (Min: 1 mL (patient) AND 1 mL (control)) Do not refrigerate or freeze. LIVE NEUTROPHILS REQUIRED.

Storage/Transport Temperature:
CRITICAL ROOM TEMPERATURE.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: Unacceptable; Frozen: Unacceptable
New York State Clients: Ambient 24 hours; Refrigerated: Unacceptable; Frozen Unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- CGD Test
- Chronic Granulomatous Disease Test
- DHR test
- Neutrophil Oxidation
- LAB3801-VML
- LAB3801VML

Ordering Recommendations:
Aid in screening for chronic granulomatous disease.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Flow Cytometry

Reported:
2-3 days

Notes:
If sample shows abnormal results when stimulated, and no control was sent, test should be resubmitted with control sample to validate the conditions of collection, processing and transport. For abnormal results, we encourage consultation with the ARUP Immunology Medical Director.

Interpretation comparing the patient results to the client normal control and the laboratory control will be provided by the medical director.

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:

White blood cells are incubated with dihydrorhodamine 123 (DHR) and catalase, then stimulated with Phorbol 12-Myristate 13-Acetate (PMA). Dihydrorhodamine oxidation to rhodamine by the respiratory burst of the cell is measured by flow cytometry.

Results are reported as the ratio of the mean channel fluorescence of stimulated cells versus unstimulated cells, which yields a stimulation index (SI).

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Neutrophil-Associated Antibodies

LAB3800

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- Anti-Granulocyte Antibodies
- Anti-Leukocyte Ab
- Anti-Neutrophil Antibodies
- Granulocyte Ab
- NAIg
- Neutrophil Antibody
- LAB3800-VML
- LAB3800VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Remove serum from cells ASAP or within 2 hours of collection. Transfer 3 mL serum to an ARUP Standard Transport Tube and freeze. (Min: 0.5 mL)

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 month

Performed:
Mon, Thu

ORDERING

Synonyms:

- Anti-Granulocyte Antibodies
- Anti-Leukocyte Ab
- Anti-Neutrophil Antibodies
- Granulocyte Ab
- NAIg
- Neutrophil Antibody
- LAB3800-VML
- LAB3800VML

Ordering Recommendations:
Support the diagnosis of immune neutropenia in various autoimmune disorders.

Performed:
Mon, Thu

Methodology:
Qualitative Flow Cytometry

Reported:
1-5 days

Notes:
Circulating antibodies in patient's serum are measured by flow cytometry after incubation with normal neutrophils. Values greater than 2 standard deviations of a normal control population are interpreted as "weakly positive" and greater than 3 standard deviations as "positive".

This test should not be confused with Anti-Neutrophil Cytoplasmic Antibody, IgG (0050811 - ANCA).

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:

Neutrophil-associated antibodies may cause neutropenia in various autoimmune disorders including Felty syndrome, SLE and drug-induced neutropenia. Febrile transfusion reactions and isoimmune neonatal neutropenia may also be caused by antibodies to neutrophil-specific antigens or HLA antigens.

A positive result on this test is not definitive for specific antineutrophil antibodies, since anti-HLA antibodies and immune complexes may also cause a positive result. The results of this test should be correlated to clinical history and other data.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Use to detect and monitor nicotine and cotinine in serum or plasma. Serum or plasma testing may be useful when a valid urine specimen cannot be obtained (eg, due to anuria or dialysis).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 15, 2022

Drugs Covered	Cutoff Concentrations
Nicotine	5 ng/mL
Cotinine (metabolite)	5 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 5 ng/mL

For medical purposes only; not valid for forensic use.

This test is designed to evaluate recent use of nicotine-containing products. Passive and active exposure cannot be discriminated definitively, although a cutoff of 10 ng/mL cotinine is frequently used for surgery qualification purposes. For smoking cessation programs or compliance testing, the absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, or limitations of testing. This test cannot distinguish between use of tobacco and purified nicotine products. The concentration value must be greater than or equal to the cutoff to be reported as positive.

Ordering Recommendations:

Use to detect and monitor nicotine and cotinine in serum or plasma. Serum or plasma testing may be useful when a valid urine specimen cannot be obtained (eg, due to anuria or dialysis).

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 5 ng/mL

For medical purposes only; not valid for forensic use.

This test is designed to evaluate recent use of nicotine-containing products. Passive and active exposure cannot be discriminated definitively, although a cutoff of 10 ng/mL cotinine is frequently used for surgery qualification purposes. For smoking cessation programs or compliance testing, the absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, or limitations of testing. This test cannot distinguish between use of tobacco and purified nicotine products. The concentration value must be greater than or equal to the cutoff to be reported as positive.

Reference Interval:

Effective August 15, 2022

Drugs Covered	Cutoff Concentrations
Nicotine	5 ng/mL
Cotinine (metabolite)	5 ng/mL

Methodology:

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Section:

80323 (Alt code: G0480)

Nicotine and Metabolites, Urine, Quantitative

LAB414

ORDERING INFO

Collect:
Random urine.

Synonyms:

- 3-Hydroxycotinine
- Pain Management
- Nicotine and Cotinine, LC/MS/MS, Urine
- Cotinine
- Anabasine
- LAB414-VML
- LAB414VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 4 mL with no additives or preservatives urine to an ARUP standard transport tube. (Min: 1 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 10 days; Refrigerated: 10 days; Frozen: 8 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- 3-Hydroxycotinine
- Pain Management
- Nicotine and Cotinine, LC/MS/MS, Urine
- Cotinine
- Anabasine
- LAB414-VML
- LAB414VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Cotinine Screen, Urine (2007081).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Nicotine	15 ng/mL
Cotinine (metabolite)	15 ng/mL
3-OH-Cotinine (metabolite)	50 ng/mL
Anabasine (tobacco biomarker)	5 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff:
Nicotine: 15 ng/mL
Cotinine: 15 ng/mL
3-OH-Cotinine: 50 ng/mL
Anabasine: 5 ng/mL

For medical purposes only; not valid for forensic use.

This test is designed to evaluate recent use of nicotine-containing products. Passive and active exposure cannot be discriminated definitively, although a cutoff of 100 ng/mL cotinine is frequently used for surgery qualification purposes. For smoking cessation programs or compliance testing, the absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Anabasine is included as a biomarker of tobacco use, versus nicotine replacement. Interpretive questions should be directed to the laboratory.

N-methyl-D-Aspartate Receptor (NMDAR) Antibody, IgG by CBA-IFA, CSF With Reflex to Titer

LAB6304

ORDERING INFO

Collect:
CSF.

Synonyms:

- anti-GluN1
- Anti-NMDA CSF
- anti-NR1
- Glutamate Receptor Antibodies
- N-Methyl D-Aspartate Ab CSF
- NMDA R
- NMDA Receptor Ab CSF
- LAB6304-VML
- LAB6304VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 0.5 mL CSF to an ARUP standard transport tube. (Min: 0.15 mL)

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- anti-GluN1
- Anti-NMDA CSF
- anti-NR1
- Glutamate Receptor Antibodies
- N-Methyl D-Aspartate Ab CSF
- NMDA R
- NMDA Receptor Ab CSF
- LAB6304-VML
- LAB6304VML

Ordering Recommendations:
Confirm diagnosis of anti-NMDAR encephalitis. May be used in monitoring treatment response in individuals who are antibody positive.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Cell-Based Indirect Fluorescent Antibody

Reported:
1-3 days

Notes:
If NMDA CSF antibody IgG is positive, then an NMDA CSF antibody IgG titer is reported. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:
Less than 1:1

Interpretive Data:
NMDA receptor antibody is found in a subset of patients with autoimmune limbic encephalitis and may occur with or without associated tumor. Decreasing antibody levels may be associated with therapeutic response. In addition, positive results have been reported in patients with nonautoimmune phenotypes. A negative test result does not rule out a diagnosis of autoimmune limbic encephalitis. Results should be interpreted in correlation with the patients clinical history and other laboratory findings.

This indirect fluorescent antibody assay utilizes full-length GluN1 transfected cell lines for the detection and semiquantification of NMDA receptor IgG antibody.

Methodology:
Semi-Quantitative Cell-Based Indirect Fluorescent Antibody

Nortriptyline (Test on Referral as of 03/05/24)

LAB807

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Synonyms:

- Nortrilen
- Pamelor
- Noritren
- Norpress
- Sensoval
- TCA
- Tricyclic Antidepressants
- Allegron
- Aventyl
- LAB807-VML
- LAB807VML

SPECIMEN REQUIREMENTS

Patient Preparation:
If amitriptyline is administered, order Amitriptyline and Nortriptyline (ARUP test code 0090158). Timing of specimen collection: Predose (trough) draw at steady-state concentration.

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 5 days; Refrigerated: 2 weeks; Frozen: 6 months

Performed:
Mon, Wed, Fri

ORDERING

NPM1 Mutation Analysis, Whole blood, bone marrow

LAB3039

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3039, NPM, Nucleophosmin
- LAB3039-VML
- LAB3039VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

Two Lavender microtainers (EDTA)

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Monday and Thursday

Stability:

EDTA and AC-A: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C

Specimen:

Whole blood or bone marrow

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

The analysis of NPM1 mutations aids in the diagnosis and management of acute myeloid leukemia (AML).

Synonyms:

- LAB3039, NPM, Nucleophosmin
- LAB3039-VML
- LAB3039VML

Performed:

Monday and Thursday

Turn Around Time:

10 days

Methodology:
Fluorescent PCR designed to detect NPM1 mutations (4 bp insertions or duplications in exon 12) with fragment size analysis by capillary electrophoresis; Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
Results must be interpreted in the appropriate clinical context. Refer to report.

Reasons for Rejection:
Client will be notified by Molecular Diagnostics Lab if specimen is rejected. Externally extracted DNA received for clinical testing will only be accepted from CLIA-certified laboratories or laboratories meeting equivalent requirements.

Components:
N/A

Stability:
EDTA and AC-A: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C

Storage/Transport Temperature:
Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Synonyms:

- LAB3039, NPM, Nucleophosmin
- LAB3039-VML
- LAB3039VML

Performed:
Monday and Thursday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
10 days

Ordering Indicators:
The analysis of NPM1 mutations aids in the diagnosis and management of acute myeloid leukemia (AML).

Interpretive Data:
Results must be interpreted in the appropriate clinical context. Refer to report.

Reference Interval:
Not detected

Additional Information:
Laboratory Developed Test

Methodology:
Fluorescent PCR designed to detect NPM1 mutations (4 bp insertions or duplications in exon 12) with fragment size analysis by capillary electrophoresis; Laboratory Developed Test

N-Telopeptide, Cross-Linked, Serum

LAB3804

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- N-Telopeptide, Cross-Linked
- NTx
- NTx Serum
- Cross-Linked N-Telopeptide
- LAB3804-VML
- LAB3804VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Severely hemolyzed specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 5 hours; Refrigerated: 24 hours; Frozen: 6 months

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- N-Telopeptide, Cross-Linked
- NTx
- NTx Serum
- Cross-Linked N-Telopeptide
- LAB3804-VML
- LAB3804VML

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Adult Male: 5.4-24.2 nM BCE
Premenopausal, Adult Female: 6.2-19.0 nM BCE

Interpretive Data:
The target value for treated postmenopausal adult females is the same as the premenopausal reference interval.
BCE = Bone Collagen Equivalent

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay

N-Telopeptide, Cross-Linked, Urine

LAB816

ORDERING INFO

Collect:
Second-morning void or 24-hour urine. Refrigerate during collection. Collect without preservative.

Synonyms:

- Collagen Crosslinks
- Cross-Linked N-Telopeptide
- Crosslinked N-telopeptide of Type I Collagen
- N-Telopeptide, Urine
- NTx
- NTX Creatinine
- NTX Urine
- Osteomark
- Osteoporosis
- LAB816-VML
- LAB816VML

SPECIMEN REQUIREMENTS

Patient Preparation:
For monitoring therapy, a baseline specimen should be collected prior to initiation of therapy. Subsequent specimens for comparison should be collected at the same time of day as the baseline specimen.

Collect:
Second-morning void or 24-hour urine. Refrigerate during collection. Collect without preservative.

Specimen Preparation:
Transfer a 1 mL aliquot of urine from a well-mixed, second-morning void or 24-hour collection to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens contaminated with blood or extensive hemolysis.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 1 week; Frozen: 4 weeks

Performed:
Tue-Sat

ORDERING

Synonyms:

- Collagen Crosslinks
- Cross-Linked N-Telopeptide
- Crosslinked N-telopeptide of Type I Collagen
- N-Telopeptide, Urine
- NTx
- NTX Creatinine
- NTX Urine
- Osteomark
- Osteoporosis
- LAB816-VML
- LAB816VML

Performed:
Tue-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay (CLIA)

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Age	Male	Female
7-9 years	167-578 nM BCE/mM creatinine	201-626 nM BCE/mM creatinine
10-12 years	152-505 nM BCE/mM creatinine	173-728 nM BCE/mM creatinine
13-15 years	103-776 nM BCE/mM creatinine	38-515 nM BCE/mM creatinine
16-17 years	34-313 nM BCE/mM creatinine	20-144 nM BCE/mM creatinine
18 years and older	21-83 nM BCE/mM creatinine	
Premenopausal		17-94 nM BCE/mM creatinine
Postmenopausal		26-124 nM BCE/mM creatinine

Interpretive Data:

NTx Units = nM BCE/mM creatinine

A decrease of 30-40% from the NTx baseline after three months of therapy is a typical response to anti-resorptive therapy.

NTx = Cross-linked N-telopeptide of Type I Collagen
BCE = Bone Collagen Equivalent

Methodology:

Quantitative Chemiluminescent Immunoassay (CLIA)

N-Terminal Pro B-Type Natriuretic Peptide, plasma

LAB5778

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB5778, ProBNP, PBN, NT Pro BNP
- LAB5778-VML
- LAB5778VML

Turn Around Time:
2 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Specimen should be centrifuged and plasma aliquoted into secondary container. (Minimum 0.4 mL plasma)

Pediatric Collection:
Lavender microtainer (EDTA)

Storage/Transport Temperature:
Room temperature

Performed:
Daily

Stability:
Ambient (15-25°C): 3 days Refrigerated (2-8°C): 6 days

Specimen:
Plasma

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is used as an aid in the diagnosis of individuals suspected of having congestive heart failure. The test is also indicative for the risk stratification of patients with acute coronary sysndrome and congestive heart failure and aids in the assessment of increased risk of cardiovascular events and mortality in patients at risk for heart failure who have stable coronary artery disease.

Synonyms:

- LAB5778, ProBNP, PBN, NT Pro BNP
- LAB5778-VML

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Synonyms:

- Olig2

Performed:
Monday-Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
2 Days

Ordering Indicators:
N/A

Interpretive Data:
N/A

Reference Interval:
N/A

Additional Information:
Complete VPLS Test Requisition. Request special requisition form No 60-002-664 if ordering on a regular basis. Package slides in durable slide holder and place with any block in padded envelope to protect from breaking.

Methodology:
Immunohistochemical Stain

Ordering Recommendations:

Preferred test to follow-up presumptive results. For general screening, Opiates, Urine Screen with Reflex to Quantitation (2005093) is preferred.

Performed:

Sun-Sat

Methodology:

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:

1-4 days

RESULTS INTERPRETATION

Reference Interval:

Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Codeine	20 ng/mL
Morphine	20 ng/mL
6-acetylmorphine	10 ng/mL
Hydrocodone	20 ng/mL
Norhydrocodone	20 ng/mL
Hydromorphone	20 ng/mL
Oxycodone	20 ng/mL
Noroxycodone	20 ng/mL
Oxymorphone	20 ng/mL
Noroxymorphone	20 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 20 ng/mL except as specified below:
6-acetylmorphine10 ng/mL

For medical purposes only; not valid for forensic use.

Identification of specific drug(s) taken by specimen donor is problematic due to common metabolites, some of which are prescription drugs themselves. The absence of expected drug(s) and/or drug metabolite(s) may indicate non-compliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. All drug analytes covered are in the non-glucuronidated (free) forms. The concentration value must be greater than or equal to the cutoff to be reported as positive. A very small amount of an unexpected drug analyte in the presence of a large amount of an expected drug analyte may reflect pharmaceutical impurity. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Orthopoxvirus (includes MPOX virus) by PCR

LAB6422

ORDERING INFO

Collect:
Viral/Universal Transport Medium (VTM/UTM) [Red Capped tube with pink liquid]

Synonyms:

- LAB6422, MPX, Pox, Non-variola, Monkeypox, MPOX, Poxvirus, Orthopox, Orthopoxvirus
- LAB6422-VML
- LAB6422VML

Turn Around Time:
72 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Vesicles contain the highest amount of monkeypox virus. Lesion swabs are the preferred specimen type. Swab multiple sites with individual swabs. Ensure appropriate PPE is worn when collecting specimens.

PLEASE NOTE: Currently this test is limited to VUMC Provider orders only.
For more information, please contact the lab at 615-875-5227.

Click here for information from the CDC web site.

Collect:
Viral/Universal Transport Medium (VTM/UTM) [Red Capped tube with pink liquid]

Specimen Preparation:
Swab: Place swab in Viral/Universal Transport Tube, break shaft off at scoreline then recap tube. Vesicles contain the highest amount of monkeypox virus. Lesion swabs are the preferred specimen type. Swab multiple sites with individual swabs. Ensure appropriate PPE is worn when collecting specimens. (Min 1.0mL VTM/UTM)

Pediatric Collection:
Viral/Universal Transport Medium (VTM/UTM) [Red Capped tube with pink liquid]

Storage/Transport Temperature:
Ambient (15-25°C)

Performed:
Monday, Friday

Stability:
Ambient (15-25°C): 24 hours; Refrigerated (2-8°C): 1 week; Frozen (-20°C) : 30 Days

Specimen:
Vesicle lesion swab, Oral swab, Genital swab, Rectal Swab

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
The clinical syndrome of Mpox (Monkeypox virus infection) can begin with a nonspecific viral prodrome, then progress to development of cutaneous lesions. These lesions can be mistaken for conditions caused by pathogens such as Herpes Simplex Virus type-1 and 2, Varicella Zoster Virus, Treponema pallidum, Rickettsia rickettsii, as well as various bacteria and fungi. Accordingly, a diagnostic test detecting Monkeypox virus is needed to differentiate the early stages of disease from more common but similarly appearing conditions.

Synonyms:

- LAB6422, MPX, Pox, Non-variola, Monkeypox, MPOX, Poxvirus, Orthopox, Orthopoxvirus
- LAB6422-VML
- LAB6422VML

Performed:
Monday, Friday

Turn Around Time:
72 hours

Methodology:
Polymerase Chain Reaction (PCR)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not Detected

Interpretive Data:
This assay does not differentiate members of the orthopoxviruses. In the United States, a detected result is most likely due to monkeypox virus or vaccinia virus. Other orthopoxviruses may be considered if appropriate. Refer to the US Centers for Disease Control and Prevention if additional confirmatory testing is needed. This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Polymerase Chain Reaction (PCR)

Osmolality, 24-hr urine

LAB3083

ORDERING INFO

Collect:

24 HR urine container with 1 mL HCL

Synonyms:

- TOU, Osmolality Urine Timed, U24TOU, Urine 24Hr Osmolality, LAB3083
- LAB3083-VML
- LAB3083VML

Turn Around Time:

STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

24 HR urine container with 1 mL HCL

Specimen Preparation:

Refrigerate during collection -- label with beginning and ending collection times and dates. It is crucial to collect every void during the 24-hr period of time with only one first-morning urine. Indicate total volume if an aliquot is sent. Mix specimen well before aliquoting.

Pediatric Collection:

24 Hour Urine Container with 1 mL HCL

Storage/Transport Temperature:

Transport: room temp; Storage: refrigeration

Performed:

Daily

Stability:

Room temp: 30 min; Refrigerated: 24 hrs; Frozen: indefinite

Specimen:

24-hr urine - toal 24 hour collection

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Osmolality is a test that measures the concentration of all chemical particles found in the fluid. It is usually ordered in the assessment of hyponatremia, poisoning such as alcohols and ethylene glycol. excessive thrist or urination.

Synonyms:

- TOU, Osmolality Urine Timed, U24TOU, Urine 24Hr Osmolality, LAB3083
- LAB3083-VML
- LAB3083VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Freeze Point

RESULTS INTERPRETATION

Reference Interval:
300 - 1100 MOSM/KG H20

Interpretive Data:
Higher than normal osmolality may indicate adrenal insufficiancy, heart failure, hypernatremia, dehydration or SIADH. Lower than normal osmolality may indicate kidney damage, diabetes insipidus, hyponatremia.

Methodology:
Freeze Point

ADDITIONAL INFORMATION

Section:
Misc Chemistry

Alternate Specimen:
N/A

Additional Information:
Things that can affect the test results include any anesthesia agent for an operation and the contrast medium for CT scan or MRI.

Resulting Laboratory:
Vanderbilt Medical Laboratories

Interpretive Data:

Higher than normal osmolality may indicate adrenal insufficiancy, heart failure, hypernatremia, dehydration or SIADH.
Lower than normal osmolality may indicate kidney damage, diabetes insipidus, hyponatremia.

Reference Interval:

300 - 1100 MOSM/KG H20

Additional Information:

Things that can affect the test results include any anesthesia agent for an operation and the contrast medium for CT scan or MRI.

Methodology:

Freeze Point

Osmolality, Serum

LAB107

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- OSM, Osmolality Blood
- LAB107-VML
- LAB107VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Red tube (no gel)

Specimen Preparation:
Collect whole blood in a plain red top (no gel), and transport to the lab at room temperature

Pediatric Collection:
Red tube microntainer

Storage/Transport Temperature:
Transport: room temp; Storage: refrigeration

Performed:
Daily

Stability:
Room temp: 30 min; Refrigerated: 24 hrs; Frozen: indefinite

Specimen:
Serum

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Osmolality is a test that measures the concentration of all chemical particles found in the fluid. It is usually ordered in the assessment of hyponatremia, poisoning such as alcohols and ethylene glycol. excessive thrist or urination.

Synonyms:

- OSM, Osmolality Blood
- LAB107-VML
- LAB107VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Freeze Point

RESULTS INTERPRETATION

Reference Interval:
285-295 mOsm/Kg H2O

Interpretive Data:
Higher than normal osmolality may indicate hyperglycemia, uremia, hypernatremia, decreased ADH secretion or dehydration. Lower than normal osmolality may indicate increased ADH secreation, SIADH or hyponatremia.

Methodology:
Freeze Point

ADDITIONAL INFORMATION

Osmotic Fragility, Erythrocyte

LAB1134

ORDERING INFO

Collect:
Green (sodium or lithium heparin) or lavender (EDTA).

Synonyms:

- FRAGILITY, OSMOTIC (RBC)
- Osmotic Fragility
- RBC Fragility, Erythrocytes
- Red Cell Fragility
- Spherocytic Hemolytic Disease
- LAB1134-VML
- LAB1134VML

SPECIMEN REQUIREMENTS

Collect:
Green (sodium or lithium heparin) or lavender (EDTA).

Specimen Preparation:
Transport 5mL whole blood. (Min: 1mL) Specimens should be refrigerated within 30 minutes after collection.

Unacceptable Conditions:
Grossly hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 72 hours; Frozen: Unacceptable

Performed:
Mon-Fri

ORDERING

Synonyms:

- FRAGILITY, OSMOTIC (RBC)
- Osmotic Fragility
- RBC Fragility, Erythrocytes
- Red Cell Fragility
- Spherocytic Hemolytic Disease
- LAB1134-VML
- LAB1134VML

Ordering Recommendations:
Functional testing of red blood cell sensitivity to osmotic stress. Do not use to distinguish between spherocytes in hereditary spherocytosis and acquired autoimmune hemolytic anemia.

Performed:
Mon-Fri

Methodology:
Spectrophotometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Within normal curve limits.

Interpretive Data:
For patients with acute hemolysis, a normal red cell osmotic fragility test result cannot exclude an osmotic fragility abnormality since the osmotically labile cells may be hemolyzed and not present. Recommend testing during a state of prolonged homeostasis with stable hematocrit.

Methodology:
Spectrophotometry

Osteocalcin by Electrochemiluminescent Immunoassay

LAB1060

ORDERING INFO

Collect:
Serum separator tube. Also acceptable: Lavender (K_2 EDTA or K_3 EDTA), pink (K_2EDTA), or green (lithium heparin).

Synonyms:

- BGLAP
- bone gamma-carboxyglutamic acid-containing protein
- N-MID osteocalcin
- Osteocalcin
- Osteocalcin (OCN)
- LAB1060-VML
- LAB1060VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Also acceptable: Lavender (K_2 EDTA or K_3 EDTA), pink (K_2EDTA), or green (lithium heparin).

Specimen Preparation:
Allow serum tube to sit for 15-20 minutes at room temperature for proper clot formation. Centrifuge and separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Hemolyzed specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 72 hours; Frozen: 3 months

Performed:
Tue-Sat

ORDERING

Synonyms:

- BGLAP
- bone gamma-carboxyglutamic acid-containing protein
- N-MID osteocalcin
- Osteocalcin
- Osteocalcin (OCN)
- LAB1060-VML
- LAB1060VML

Performed:
Tue-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Age	Male	Female
6 months-6 years	39-121 ng/mL	44-130 ng/mL
7-9 years	66-182 ng/mL	73-206 ng/mL
10-12 years	85-232 ng/mL	77-262 ng/mL
13-15 years	70-336 ng/mL	33-222 ng/mL
16-17 years	43-237 ng/mL	24-99 ng/mL
18 years and older	8-36 ng/mL	8-36 ng/mL

Interpretive Data:
In patients with renal failure, the osteocalcin result may be directly elevated, due to impaired clearance, and/or indirectly elevated due to renal osteodystrophy.

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Ova and Parasite Exam, Body Fluid or Urine

LAB6092

ORDERING INFO

Collect:
Body fluid, CSF, or urine.

Synonyms:

- URINE O&P exam
- Amoeba
- echinococcus, hydatid cyst, hydatid sand, amoebiasis
- O&P body fluids
- parasitic worms
- S. haematobium
- S. japonicum.
- Schistosoma mansoni
- Strongyloides
- LAB6092-VML
- LAB6092VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Urine: If S. haematobium is suspected, collect at midday or 24-hour collection in a container without preservative. Peak egg excretion occurs between noon and 3 p.m.

Collect:
Body fluid, CSF, or urine.

Specimen Preparation:
Transfer 4 mL body fluid, CSF, or urine to an ARUP standard transport tube. (Min: 1 mL)

Storage/Transport Temperature:
Body Fluid or Urine: Refrigerated.
CSF: Room temperature.

Stability (from collection to initiation):
Body Fluid: Ambient: 72 hours; Refrigerated: 72 hours; Frozen: Unacceptable
Urine: Ambient: 72 hours; Refrigerated: 72 hours; Frozen: Unacceptable
CSF: Ambient: 72 hours; Refrigerated: Unacceptable; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Specimen source required.

ORDERING

Synonyms:

- URINE O&P exam
- Amoeba

Ova and Parasite Exam, Fecal (Immunocompromised or Travel History)

LAB6093

ORDERING INFO

Collect:
Stool. Recommended collection: 3 separate stool specimens within a 5-7-day period (an individual order must be submitted for each specimen).

Synonyms:

- Strongyloides
- Ascaris
- Chlonorchis sinensis
- Eggs or Cysts
- Fasciola
- Giardia Exam
- Helminths
- Isospora, Isospora belli, Cystoisospora
- O and P
- Opisthorchis sinensis
- Parasites
- Parasitic Exam
- Parasitic examination, stool
- parasitic worms
- Parasitology Examination
- Protozoa
- S. haematobium
- S. japonicum
- Sarcocystis
- Schistosoma mansoni
- LAB6093-VML
- LAB6093VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Specimens analyzed to determine the efficacy of treatment should be collected three to four weeks after completion of therapy. Antibiotics may affect results of exam.

Collect:
Stool. Recommended collection: 3 separate stool specimens within a 5-7-day period (an individual order must be submitted for each specimen).

Specimen Preparation:
Transfer 2 g of stool within one hour of collection into AlcorFix (ARUP Supply #52059) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787. (Min: 1 g)
Also acceptable: Transfer 5 g of stool within one hour of collection into both 10 percent formalin and modified PVA (10 g total). (Min: 10 g total)
Additional specimen collection instructions can be found at https://www.aruplab.com/parasep.

Unacceptable Conditions:
Rectal swabs. Multiple specimens (more than one in 24 hours). Unpreserved specimens. Specimens preserved in SAF (sodium acetate formalin). Specimens containing barium, bismuth, or urine.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 9 months; Refrigerated: 9 months; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Indicate suspected parasites.

ORDERING

Synonyms:

- Strongyloides
- Ascaris
- Chlonorchis sinensis
- Eggs or Cysts
- Fasciola
- Giardia Exam
- Helminths
- Isospora, Isospora belli, Cystoisospora
- O and P
- Opisthorchis sinensis
- Parasites
- Parasitic Exam
- Parasitic examination, stool
- parasitic worms
- Parasitology Examination
- Protozoa
- S. haematobium
- S. japonicum
- Sarcocystis
- Schistosoma mansoni
- LAB6093-VML
- LAB6093VML

Ordering Recommendations:
If parasite infection is suspected as cause of persistent diarrhea (>14 days), specific pathogen testing is recommended (refer to Gastrointestinal Parasite Panel by PCR (2011150); Giardia Antigen by EIA (0060048); Entamoeba histolytica Antigen, EIA (0058001); or Cryptosporidium Antigen by EIA (0060045)). Do not order for patients who develop diarrhea during a prolonged hospitalization.

Performed:
Sun-Sat

Methodology:
Qualitative Concentration/Trichrome Stain/Microscopy

Reported:
3-7 days

Notes:
For ova and parasite exams from nonstool sources, refer to Ova and Parasite Exam, Body Fluid or Urine (ARUP test code 3001663). For Cryptosporidium, Cyclospora, and Cystoisospora stains, refer to Parasitology Stain by Modified Acid-Fast (ARUP test code 0060046). For macroscopic parasite identification (worms or proglottids), refer to Parasite Examination, Macroscopic (ARUP test code 2007361). For additional test information refer to ARUP Consult, https://arupconsult.com/content/diarrhea

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Method for identification of ova and parasites includes wet mount and trichrome stain.

Due to the various shedding cycles of many parasites, three separate stool specimens collected over a 5-7-day period are recommended for ova and parasite examination. A single negative result does not rule out the possibility of a parasitic infection. The ova and parasite exam does not specifically detect Cryptosporidium, Cyclospora, Cystoisospora, and Microsporidia. For additional test information refer to ARUP Consult, https://arupconsult.com/content/diarrhea

Methodology:
Qualitative Concentration/Trichrome Stain/Microscopy

Oxalate, Plasma

LAB3805

ORDERING INFO

Collect:
Green (lithium or sodium heparin) or Lavender (EDTA) or pink (K_2EDTA).

Synonyms:

- LAB3805-VML
- LAB3805VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should avoid ingestion of vitamin C for 24 hours prior to sample collection.

Collect:
Green (lithium or sodium heparin) or Lavender (EDTA) or pink (K_2EDTA).

Specimen Preparation:
Place tube on wet ice immediately after collection. Separate plasma from cells ASAP or within 1 hour of collection. Transfer 2 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 1.5 mL)

Unacceptable Conditions:
Samples that are not plasma. Samples not received frozen.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 week

Performed:
Mon, Fri

ORDERING

Synonyms:

- LAB3805-VML
- LAB3805VML

Ordering Recommendations:
Assess the body pool size of oxalate.

Performed:
Mon, Fri

Methodology:
Quantitative Spectrophotometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 2.0 µmol/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Oxalate, Urine

LAB421

ORDERING INFO

Collect:
24-hour urine. Refrigerate during collection.

Synonyms:

- Hyperoxaluria
- Oxalate
- LAB421-VML
- LAB421VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should avoid ingestion of vitamin C prior to collection.

Collect:
24-hour urine. Refrigerate during collection.

Specimen Preparation:
Thoroughly mix entire collection (24-hour) in one container. Do not exceed 4 mL in Tubes.
Preserved: Transfer 4 mL aliquot to an ARUP Transport Tube with Sulfamic Acid (ARUP supply #48098). Available online through eSupply using ARUP Connect or contact ARUP client services at (800) 522-2787. (Min: 1.5 mL) Mix well. Freeze immediately.
Unpreserved: Transport a 4 mL unadjusted aliquot of urine to an ARUP Standard Transport Tube. (Min: 1.5 mL) Freeze immediately.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered

Stability (from collection to initiation):
After collection complete: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 month

Performed:
Mon-Fri

Remarks:
Record total volume and collection time interval on transport tube and test request form.

Quantitative Spectrophotometry

Reported:
1-4 days

Notes:
Vitamin C (ascorbic acid) quickly degrades to oxalate in non-acidified urine. Patients should discontinue use of vitamin C supplements at least 48 hours prior to the start of urine collection and abstain until collection is complete.

Preservation with Sulfamic Acid before transporting is highly recommended.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval

Creatinine, Urine - per 24h

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Oxalate, Urine - per 24h

Age	Male (mg/d)	Female (mg/d)
0-12 years	7-31	7-31
13 years and older	16-49	13-40

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative Spectrophotometry

ADDITIONAL INFORMATION

CPT Codes:

83945

Section:

RF-ARUP

Remarks:

Record total volume and collection time interval on transport tube and test request form.

Notes:

Vitamin C (ascorbic acid) quickly degrades to oxalate in non-acidified urine. Patients should discontinue use of vitamin C supplements at least 48 hours prior to the start of urine collection and abstain until collection is complete.

Preservation with Sulfamic Acid before transporting is highly recommended.

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

24-hour urine. Refrigerate during collection.

Specimen Preparation:

Thoroughly mix entire collection (24-hour) in one container. Do not exceed 4 mL in Tubes.
Preserved: Transfer 4 mL aliquot to an ARUP Transport Tube with Sulfamic Acid (ARUP supply #48098). Available online through eSupply using ARUP Connect or contact ARUP client services at (800) 522-2787. (Min: 1.5 mL) Mix well. Freeze immediately.
Unpreserved: Transport a 4 mL unadjusted aliquot of urine to an ARUP Standard Transport Tube. (Min: 1.5 mL) Freeze immediately.

Patient Preparation:

Patient should avoid ingestion of vitamin C prior to collection.

Stability (from collection to initiation):

After collection complete: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 month

Storage/Transport Temperature:

CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered

Synonyms:

- Hyperoxaluria
- Oxalate
- LAB421-VML
- LAB421VML

Performed:
Mon-Fri

Resulting Laboratory:
ARUP Laboratories

Oxcarbazepine or Eslicarbazepine Metabolite (MHD)

LAB6064

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2 EDTA).

Synonyms:

- 10-Hydroxycarbazepine
- 10-OH-Carbazepine (MHD)
- 11-Dihydrocarbamazepine
- Eslicarbazepine
- GP 47680
- Metabolite of Oxcarbazepine
- MHC
- MHD
- Monohydroxy Carbamazepine
- Oxcarbazepine
- Monohydroxy Carbamazepine (MHD)
- Oxcarbazepine Metabolite, 10-Hydroxy-10
- Trileptal (Parent Pro-Drug)
- Oxcarbazepine Metabolite
- 10-Hydroxy-10,11-Dihydrocarbamazepine
- LAB6064-VML
- LAB6064VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2 EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 6 weeks; Refrigerated: 6 weeks; Frozen: 3 months (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

P/Q-Type Voltage-Gated Calcium Channel (VGCC) Antibody

LAB4153

ORDERING INFO

Collect:
Plain Red or Serum Separator Tube (SST).

Synonyms:

- VGCC Ab
- Lambert Eaton
- Lambert-Eaton
- P/Q calcium channel
- LAB4153-VML
- LAB4153VML

SPECIMEN REQUIREMENTS

Collect:
Plain Red or Serum Separator Tube (SST).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Plasma. CSF. Hemolyzed or grossly lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Tue

ORDERING

Synonyms:

- VGCC Ab
- Lambert Eaton
- Lambert-Eaton
- P/Q calcium channel
- LAB4153-VML
- LAB4153VML

Ordering Recommendations:
Detect antibodies for P/Q type voltage-gated calcium channels. Aid in the evaluation of muscle weakness in the context neuromuscular junction disorder with or without cancer, or the diagnosis of paraneoplastic neurological syndromes.

Performed:
Tue

Methodology:
Quantitative Radioimmunoassay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
P/Q-Type Calcium Channel Antibody	24.5 pmol/L or less

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
P/Q-Type Calcium Channel Antibody	0.0 to 24.5 pmol/L: Negative 24.6 to 45.6 pmol/L: Indeterminate 45.7 pmol/L or greater: Positive

Pancreatic Elastase, Fecal

LAB6505

ORDERING INFO

Collect:

Stool in clean container

Synonyms:

- Fecal Elastase
- Pancreatic Elastase, Stool
- LAB6505-VML
- LAB6505VML

Turn Around Time:

1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:

NA

Collect:

Stool in clean container

Specimen Preparation:

Collect stool sample in clean container, store refrigerated.

Pediatric Collection:

Stool in clean container

Storage/Transport Temperature:

Refrigerated (2-8°C)

Performed:

Monday - Friday

Stability:

Refrigerated (2-8°C): 72 hours

Specimen:

Stool

Alternate Specimen:

NA

ORDERING

Ordering Indicators:

This test is used to detect exocrine pancreatic insufficiency.

Synonyms:

- Fecal Elastase
- Pancreatic Elastase, Stool
- LAB6505-VML

Pancreatic Polypeptide

LAB3806

ORDERING INFO

Collect:
Serum separator tube or plain red.

Synonyms:

- PP
- HPP
- Human Pancreatic Polypeptide
- Pancreatic Polypeptide
- LAB3806-VML
- LAB3806VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should be fasting for 10 hours prior to collection of specimen.

Collect:
Serum separator tube or plain red.

Specimen Preparation:
Allow specimen to sit in collection tube for 15-20 minutes at room temperature for proper clot formation. Centrifuge and separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Severely hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 24 hours; Frozen: 2 months

Performed:
Wed

ORDERING

Synonyms:

- PP
- HPP
- Human Pancreatic Polypeptide
- Pancreatic Polypeptide
- LAB3806-VML
- LAB3806VML

Ordering Recommendations:
Aids in the diagnosis and monitoring of pancreatic neuroendocrine tumors.

Performed:
Wed

Methodology:
Quantitative Radioimmunoassay

Reported:
3-11 days

RESULTS INTERPRETATION

Parathyroid Hormone-Related Peptide (PTHrP) by LC-MS/MS, Plasma

LAB3808

ORDERING INFO

Collect:

Protease Inhibitor tube (PPACK; Phe-Pro-Arg-chloromethylketone) (ARUP supply #49662), available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. A winged collection set must be used.

Synonyms:

- Parathyroid Hormone Related Peptide
- PTH-RP
- Parathyroid Hormone Related Protein
- Parathyroid Related Polypeptide
- Parathyroid Related Protein
- PRP
- PTH Related Peptide
- PTH Related Protein
- PTHrP secretion
- HHM
- PTHRP, Plasma
- Humoral Hypercalcemia of Malignancy Factor
- LAB3808-VML
- LAB3808VML

SPECIMEN REQUIREMENTS

Collect:

Protease Inhibitor tube (PPACK; Phe-Pro-Arg-chloromethylketone) (ARUP supply #49662), available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. A winged collection set must be used.

Specimen Preparation:

Mix well. Separate from cells within 1 hour of collection. Transfer 1.5 mL plasma to an ARUP Standard Transport Tube. (Min: 0.7 mL)

Unacceptable Conditions:

Grossly hemolyzed specimens.

Storage/Transport Temperature:

Frozen. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):

After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 3 months

Performed:

Sun, Mon, Wed, Fri

ORDERING

Synonyms:

- Parathyroid Hormone Related Peptide
- PTH-RP
- Parathyroid Hormone Related Protein
- Parathyroid Related Polypeptide
- Parathyroid Related Protein
- PRP
- PTH Related Peptide
- PTH Related Protein
- PTHrP secretion
- HHM
- PTHRP, Plasma
- Humoral Hypercalcemia of Malignancy Factor
- LAB3808-VML
- LAB3808VML

Ordering Recommendations:

Aid in the evaluation of unexplained hypercalcemia, particularly in suspected hypercalcemia of malignancy. Amino (N)- and carboxy (C)-terminus PTHrP fragments, such as those produced by some patients with renal insufficiency, do not interfere with this assay.

Performed:
Sun, Mon, Wed, Fri

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-6 days

Notes:
Amino (N)- and carboxy (C)-terminus PTHrP fragments, such as those produced by some patients with renal insufficiency, do not interfere with this assay.

Partial Thromboplastin Time

LAB325

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB325, aPTT, Activated Partial Thromboplastin Time, PTT
- LAB325-VML
- LAB325VML

Turn Around Time:

2 hours, once received into the lab

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. Process the sample carefully to avoid platelet activation during centrifugation. PF-4 released from the platelet granules is a potent heparin inhibitor, and release of PF-4 may affect the PTT result if the test is being used to monitor UFH. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

RESULTS INTERPRETATION

Reference Interval:
23.5-33.5 seconds

Interpretive Data:
Anti-IIa (thrombin) inhibitors and both direct and indirect Xa inhibitors may interfere with these assays. Therapeutic levels of coumadin may cause a prolongation of the PTT. The presence of Hemlibra (emicizumab) in the sample may considerably shortened PTT to within , or shorter than, the normal reference range.

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
PTT cannot be used for monitorming LMWH or direct Xa inhibitor therapy.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:
Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. Process the sample carefully to avoid platelet activation during centrifugation. PF-4 released from the platelet granules is a potent heparin inhibitor, and release of PF-4 may affect the PTT result if the test is being used to monitor UFH. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:
Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Preferred Collection Volume:
Fill all tubes to indicator line.

Alternate Specimen:
N/A

Patient Preparation:
Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Specimen:
Citrated platelet poor plasma.

Reasons for Rejection:
Incorrect tube type, clotted, incorrect fill volume, received on ice, grossly hemolyzed, grossly icteric, grossly lipemic. Whole blood > 4 hours after collection. Thawed plasma aliquots.

Components:
N/A

Stability:
Ambient (15-25°C): 4 hours

Storage/Transport Temperature:
Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Synonyms:

- LAB325, aPTT, Activated Partial Thromboplastin Time, PTT
- LAB325-VML
- LAB325VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
2 hours, once received into the lab

Ordering Indicators:
N/A

Interpretive Data:
Anti-IIa (thrombin) inhibitors and both direct and indirect Xa inhibitors may interfere with these assays. Therapeutic levels of coumadin may cause a prolongation of the PTT. The presence of Hemlibra (emicizumab) in the sample may considerably shortened PTT to within , or shorter than, the normal reference range.

Reference Interval:
23.5-33.5 seconds

Additional Information:
PTT cannot be used for monitorming LMWH or direct Xa inhibitor therapy.

Methodology:
Clotting

Parvovirus B19 by Quantitative PCR

LAB6381

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), or serum separator tube (SST).

Synonyms:

- Parvovirus B19
- Viral load monitoring
- LAB6381-VML
- LAB6381VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), or serum separator tube (SST).

Specimen Preparation:
Separate serum or plasma from cells. Transfer 1 mL serum, plasma to a sterile container. (Min: 0.5 mL)

Unacceptable Conditions:
Heparinized specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 5 days; Frozen: 6 months

Performed:
Mon, Wed, Fri

Remarks:
Specimen source required.

ORDERING

Synonyms:

- Parvovirus B19
- Viral load monitoring
- LAB6381-VML
- LAB6381VML

Ordering Recommendations:
Diagnose and monitor human parvovirus infection in patient with suppressed or delayed immune response.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Polymerase Chain Reaction

Reported:
1-4 days

Notes:
The limit of quantification for this DNA test is 2.0 log IU/mL (100 IU/mL). If the test DID NOT DETECT the virus, the test result will be reported as "< 2.0 log IU/mL (< 100 IU/mL)." If the test DETECTED the presence of the virus but was not able to accurately quantify the number of international units, the test result will be reported as "Not Quantified."

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
The quantitative range of this test is 2.0- 8.0 log IU/mL (100 - 100,000,000 IU/mL).

A negative result (less than 2.0 log IU/mL or less than 100 IU/mL) does not rule out the presence of PCR inhibitors in the patient specimen or Parvovirus DNA concentrations below the level of detection of the test. Inhibition may also lead to underestimation of viral quantitation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Polymerase Chain Reaction

Purkinje Cell/Neuronal Nuclear IgG Scrn	None Detected

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody/Qualitative Immunoblot

Section:
RF-ARUP

CPT Codes:
86255; if reflexed add 84182 x4 and/or 86256

Notes:
Purkinje Cell (PCCA) antibody and Neuronal Nuclear (ANNA) antibody IgG are screened by IFA. If the IFA screen is indeterminate, then a Neuronal Nuclear Antibodies (Hu, Ri, Yo, and Tr/DNER) IgG by Immunoblot will be added. If the IFA screen is positive at 1:10 or greater, then a PCCA/ANNA antibodies titer and Neuronal Nuclear Antibodies (Hu, Ri, Yo, and Tr/DNER) IgG by Immunoblot will be added. Additional charges apply.

PD-1 (NAT105) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

PERICARDIAL FLUID CYTOLOGY

ORDERING INFO

Collect:
Clean specimen container.

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container.

Specimen Preparation:
1. Collect specimen in a clean specimen container (min 1 mL). 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: 100 mL is optimal)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Fresh specimen in a clean specimen container.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc.

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Methodology:
ThinPrep procedure

Patient Preparation:
N/A

Collect:
Clean specimen container.

Specimen Preparation:
1. Collect specimen in a clean specimen container (min 1 mL). 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: 100 mL is optimal)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Fresh specimen in a clean specimen container.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc.

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Methodology:
ThinPrep procedure

pH Arterial

LAB4534

ORDERING INFO

Collect:
Heparinized syringe

Synonyms:

- APH, pH Art, LAB4534
- LAB4534-VML
- LAB4534VML

Turn Around Time:
30 Minutes After Collection

SPECIMEN REQUIREMENTS

Collect:
Heparinized syringe

Specimen Preparation:
Collect whole blood in a heparized syringe at room temperature and transport to the lab within 30 minutes, tube must not be clotted (Min: 250ul)

Pediatric Collection:
Microtainers and pediatric bullets are unacceptable

Storage/Transport Temperature:
Room Temperature: 15° to 25°C

Performed:
Daily

Stability:
15° to 25°C: 30 Minutes

Specimen:
Arterial blood

Alternate Specimen:

pH, Fecal

LAB109

ORDERING INFO

Collect:
Stool.

Synonyms:

- fecal pH
- Stool pH
- LAB109-VML
- LAB109VML

SPECIMEN REQUIREMENTS

Collect:
Stool.

Specimen Preparation:
Transfer 5 g stool to an unpreserved stool transport vial (ARUP Supply #40910) and freeze immediately. Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 g)

Unacceptable Conditions:
Diapers. Specimens containing barium. Specimens in media or preservatives. Grossly bloody specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated:2 weeks; Frozen: 2 weeks

Performed:
Sun-Sat

Pharmacogenomics, Whole Blood or Tissue

LAB6342

ORDERING INFO

Collect:

Blood: Lavender tube (EDTA); Buccal: 4 swabs

Synonyms:

- LAB6342, PREDICT
- LAB6342-VML
- LAB6342VML

Turn Around Time:

STAT: 6 - 8 days; Routine: 10 - 14 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Blood: Lavender tube (EDTA); Buccal: 4 swabs

Specimen Preparation:

Specimen should be a dedicated tube (no tube sharing with other labs or add-on testing). Test sample must be collected at Vanderbilt. Outside samples will not be accepted. (Min 0.5mL whole blood)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Blood: Ambient (15-25°C) or Refrigerated (2-8°C); Buccal: Ambient (15-25°C)

Performed:

Phencyclidine (PCP), Urine, Quantitative

LAB6108

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Phenylcyclohexylpeperidine
- PCP
- Phencyclidine
- LAB6108-VML
- LAB6108VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transport 1 mL urine. (Min: 0.5 mL)

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years (Avoid repeated freeze/thaw cycles)

Performed:
Mon

ORDERING

Synonyms:

- Phenylcyclohexylpeperidine
- PCP
- Phencyclidine
- LAB6108-VML
- LAB6108VML

Ordering Recommendations:
Preferred test to follow-up presumptive results. For general screening, Phencyclidine, Urine Screen with Reflex to Quantitation (2012265) is preferred.

Performed:
Mon

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-8 days

Notes:
Compare to Pain Management, Phencyclidine, Quantitative, with medMATCH, Urine; Pain Management, Phencyclidine, with Confirmation with medMATCH, Urine.

RESULTS INTERPRETATION

Reference Interval:
Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Phencyclidine	10 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry.

Positive cutoff: 10 ng/mL.

For medical purposes only; not valid for forensic use.

The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Phenylketonuria Monitoring, plasma

LAB3472

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3472, PKP, PKU, Phenylketonuria, Amino Acid PKU
- LAB3472-VML
- LAB3472VML

Turn Around Time:

3 days Not available STAT. Call the lab for expedited request.

SPECIMEN REQUIREMENTS

Patient Preparation:

Patient should be fasting for 2 - 3 hours prior to collection. Newborn infants are preferrable to be collected 24 hr after birth.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Preferred: Samples should be delivered to the laboratory on ice within 4 hours of collection. Samples from outside facilities should be sent as spun, separated, and frozen aliquot. (Minimum: 150 uL plasma) Alternative: Samples are viable up to 7 days from collection for testing. In the event a home collection kit is utilized, mial-in kits should be mailed to 445 Great Circle Road, Nashville, TN 37228.

Pediatric Collection:

Lavender microtainer (EDTA)

Storage/Transport Temperature:

Frozen (-20°C)

Performed:

Monday - Friday

Stability:

After separation from cells: Frozen (-20°C): 6 months

Specimen:

Plasma

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

This test is intended for monitoring treatment in patients with a known diagnosis of phenylketonuria or hyperphenylalaninemia.

Synonyms:

- LAB3472, PKP, PKU, Phenylketonuria, Amino Acid PKU
- LAB3472-VML
- LAB3472VML

Performed:

Monday - Friday

Turn Around Time:
3 days Not available STAT. Call the lab for expedited request.

Methodology:
Liquid chromatography/tandem mass spectrometry

Components:
Phenylalanine, Tyrosine, Valine, Leucine, Isoleucine, Tryptophan, PKU Target

RESULTS INTERPRETATION

Reference Interval:
Supplied with results

Interpretive Data:
For newborn infants, phenyalanine greater than 200 mcmol/L is considered diagnostic of phenylketonuria. In diagnosed patients, appropriate phenylalanine levels vary with age and pregnancy.

Methodology:
Liquid chromatography/tandem mass spectrometry

ADDITIONAL INFORMATION

Phenytoin, Free and Total

LAB6148

ORDERING INFO

Collect:
Plain Red.

Synonyms:

- Protein Free Phenytoin
- Dilantin, Free
- Diphenylhydantoin
- pheyntoin blood concentration
- Dilantin, Total and Free
- Diphenylan
- Fosphenytoin
- Free Dilantin
- Free Phenytoin
- Phenytek
- LAB6148-VML
- LAB6148VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain Red.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Whole blood. Citrated plasma. Serum separator tubes (SST). Tubes that contain liquid anticoagulant.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 4 days; Refrigerated: 4 days; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Protein Free Phenytoin
- Dilantin, Free
- Diphenylhydantoin
- pheyntoin blood concentration
- Dilantin, Total and Free
- Diphenylan
- Fosphenytoin
- Free Dilantin
- Free Phenytoin
- Phenytek
- LAB6148-VML
- LAB6148VML

Ordering Recommendations:
Preferred test for therapeutic drug management in patients with renal failure or conditions that may alter albumin concentrations.

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme Multiplied Immunoassay Technique

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Effective May 16, 2016

Components	Therapeutic Range
Phenytoin - Total	Therapeutic: 10.0-20.0 µg/mL Toxic: > 30.0 µg/mL
Phenytoin - Free Level	Therapeutic: 1.0-2.5 µg/mL Toxic: > 2.5 µg/mL
Phenytoin - Percent Free	8.0-14.0%

Interpretive Data:

The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Free phenytoin may be important to monitor in patients with altered or unpredictable protein binding capacity because phenytoin is highly bound (greater than 90 percent) at therapeutic concentrations. Phenytoin is also subject to drug-drug interactions due to displacement of protein binding and extensive metabolism. Cross-reactivity with metabolites may account for differences in phenytoin concentrations among analytical methods. Calculating percent free attempts to minimize differences in assay cross-reactivity and may be useful in dose optimization.

- Phenytek
- LAB6148-VML
- LAB6148VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:
1-4 days

Ordering Recommendations:
Preferred test for therapeutic drug management in patients with renal failure or conditions that may alter albumin concentrations.

Interpretive Data:
The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Free phenytoin may be important to monitor in patients with altered or unpredictable protein binding capacity because phenytoin is highly bound (greater than 90 percent) at therapeutic concentrations. Phenytoin is also subject to drug-drug interactions due to displacement of protein binding and extensive metabolism. Cross-reactivity with metabolites may account for differences in phenytoin concentrations among analytical methods. Calculating percent free attempts to minimize differences in assay cross-reactivity and may be useful in dose optimization.

Reference Interval:
Effective May 16, 2016

Components	Therapeutic Range
Phenytoin - Total	Therapeutic: 10.0-20.0 µg/mL Toxic: > 30.0 µg/mL
Phenytoin - Free Level	Therapeutic: 1.0-2.5 µg/mL Toxic: > 2.5 µg/mL
Phenytoin - Percent Free	8.0-14.0%

Methodology:
Quantitative Enzyme Multiplied Immunoassay Technique

Phenytoin, Plasma or Serum

LAB31

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- Dilantin, PYT, LAB31
- LAB31-VML
- LAB31VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Dark Green Microtainer (Sodium Heparin)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 2 days; 2° to 8°C: 1 month; Frozen: 5 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Phosphatidylethanol (PEth), Whole Blood, Quantitative

LAB6121

ORDERING INFO

Collect:
Lavender (K2 or K3EDTA), pink (K2EDTA), dark green (lithium heparin), or gray (potassium oxalate).

Synonyms:

- 1-palmitoyl-2-oleoyl-sn-glycero-3-phosphoethanol
- 1,2-dioleoyl-sn-glycero-3-phosphoethanol
- LAB6121-VML
- LAB6121VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (K2 or K3EDTA), pink (K2EDTA), dark green (lithium heparin), or gray (potassium oxalate).

Specimen Preparation:
Transport 1 mL whole blood. (Min: 0.5 mL)

Unacceptable Conditions:
Gel separator tubes, plain red, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 2 weeks; Frozen: 1 month (-20°C)

Performed:
Sun-Sat

ORDERING

- 1-palmitoyl-2-oleoyl-sn-glycero-3-phosphoethanol
- 1,2-dioleoyl-sn-glycero-3-phosphoethanol
- LAB6121-VML
- LAB6121VML

Ordering Recommendations:
Biomarker associated with ethanol consumption; may be helpful in monitoring alcohol abstinence.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Effective September 8, 2020

By Report

Interpretive Data:
Phosphatidylethanol (PEth) is a group of phospholipids formed in the presence of ethanol, phospholipase D, and phosphatidylcholine. PEth is known to be a direct alcohol biomarker. The predominant PEth homologues are PEth 16:0/18:1 (POPEth) and PEth 16:0/18:2 (PLPEth), which account for 37-46% and 26-28% of the total PEth homologues, respectively. PEth is incorporated into the phospholipid membrane of red blood cells and has a general half-life of 4-10 days and a window of detection of 2-4 weeks. However, the window of detection is longer in individuals who chronically or excessively consume alcohol. Serial monitoring of PEth may be helpful in monitoring alcohol abstinence over time. PEth results should be interpreted in the context of the patient's clinical and behavioral history. Patients with advanced liver disease may have falsely elevated PEth concentrations (Nguyen VL, et al, Alcoholism: Clinical and Experimental Research, 2018).

Phosphatidylserine Antibodies, IgG, IgM, and IgA

LAB1180

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- aPS Antibodies
- aPS Antibodies IgG, IgM, IgA
- Anti-Phosphatidylserine
- Antiphosphatidylserine
- LAB1180-VML
- LAB1180VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Sun, Tue, Wed, Fri, Sat

ORDERING

Synonyms:

- aPS Antibodies
- aPS Antibodies IgG, IgM, IgA
- Anti-Phosphatidylserine
- Antiphosphatidylserine
- LAB1180-VML
- LAB1180VML

Ordering Recommendations:
Not a recommended panel for the diagnosis of antiphospholipid syndrome (APS). The combined IgG and IgM Phosphatidylserine test is the preferred second-line testing in seronegative APS.

Performed:
Sun, Tue, Wed, Fri, Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Phosphatidylserine Antibody IgG	Less than 16 GPS
Phosphatidylserine Antibody IgM	Less than 22 MPS
Phosphatidylserine Antibody IgA	Less than 20 APS

Interpretive Data:
IgG and/or IgM antibodies to phosphatidylserine (aPS) may be associated with a positive test for anti-cardiolipin autoantibodies (aCL) and risk for obstetric antiphospholipid syndrome (APS). Strong clinical correlation is recommended in the absence of lupus anticoagulant, IgG and/or IgM cardiolipin and/or beta2 glycoprotein antibodies.

Isolated presence of IgM or IgG antibodies to aPS may have questionable clinical significance for APS and/or SLE.

If results are positive, repeat testing with two or more specimens drawn at least 12 weeks apart to demonstrate persistence of antibodies.

Results should not be used alone for diagnosis and must be interpreted in light of APS-specific clinical manifestations and/or other criteria phospholipid antibody tests.

Phospholipase A2 Receptor (PLA2R) Antibody, IgG with Reflex to Titer

LAB6496

ORDERING INFO

Collect:
Serum Separator Tube

Synonyms:

- Anti-PLA2R
- LAB6496-VML
- LAB6496VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Hemolyzed, hyperlipemic,icteric, heat-treated or contaminated

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1year

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Anti-PLA2R
- LAB6496-VML
- LAB6496VML

Ordering Recommendations:
Aids in the differential diagnosis of membranous glomerulonephritis (MGN) or nephrotic syndrome of unknown etiology.

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Reported:
1-6 days

Notes:
If Phospholipase A2 Receptor Antibody, IgG is positive, then a Phospholipase Receptor A2 Antibody, IgG titer will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:
Less than 1:10

Interpretive Data:
A positive result (1:10 or greater) for phospholipase A2 receptor antibody, IgG in conjunction with other laboratory and clinical findings, supports a diagnosis of primary membranous glomerulonephritis (pMGN).

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody

Plasminogen Activator Inhibitor 1, Activity

LAB1124

ORDERING INFO

Collect:
Lt. blue (sodium citrate). Refer to Specimen Handling at aruplab.com for hemostasis/thrombosis specimen handling guidelines.

Synonyms:

- PAI-1
- Plasminogen Activator Inhibitor 1
- LAB1124-VML
- LAB1124VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect specimen between 8 a.m. and 12 p.m.

Collect:
Lt. blue (sodium citrate). Refer to Specimen Handling at aruplab.com for hemostasis/thrombosis specimen handling guidelines.

Specimen Preparation:
Centrifuge plasma. Within 1 hour of draw, transfer 1.5 mL platelet-poor plasma to an ARUP Standard Transport Tube and freeze. (Min: 1 mL)

Unacceptable Conditions:
Serum, EDTA plasma, clotted or hemolyzed specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Additional specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: Unacceptable; Frozen: 2 months

Performed:
Tue, Wed, Thu

ORDERING

Synonyms:

- PAI-1
- Plasminogen Activator Inhibitor 1
- LAB1124-VML
- LAB1124VML

Ordering Recommendations:
Detect elevated concentrations of plasminogen activator inhibitor 1 (PAI-1). Low concentrations of PAI-1 may not be accurately quantified. Not a first-line test for diagnosing inherited thrombotic or bleeding disorders.

Performed:
Tue, Wed, Thu

Methodology:
Bioimmunoassay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Refer to report

Methodology:
Bioimmunoassay

Plasminogen Activity

LAB847

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB847, PLS
- LAB847-VML
- LAB847VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Monday - Friday

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Platelet Aggregation

LAB1177

ORDERING INFO

Collect:
The sample must be collected at TVC by clinic staff or laboratory phlebotomy staff.

Synonyms:

- LAB1177, PAG
- LAB1177-VML
- LAB1177VML

Turn Around Time:
2-10 days for interpretive report

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should not take over the counter medications for 10 days prior to testing. Patient should be fasting from midnight and they must arrive at Vanderbilt between 8:00 and 8:30 a.m. on the day of testing.

Collect:
The sample must be collected at TVC by clinic staff or laboratory phlebotomy staff.

Specimen Preparation:
Must be scheduled with the Vanderbilt Medical Esoteric Coagulation Laboratory, 615-875-5633.

Pediatric Collection:
Ten to twelve 2.7 mL light blue tubes (3.2% Sodium Citrate). One 2.7 mL lavender (EDTA).

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Monday - Friday by appointment.

Stability:
Ambient (15-25°C): 1 hour

Specimen:
Citrated platelet poor plasma.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Testing must be scheduled with Vanderbilt Medical Esoteric Coagulation Laboratory 615 875-5633 This assay provides information on the functional aspects of platelets.

Platelet Associated Antibodies, Direct Assay

LAB3811

ORDERING INFO

Collect:
Lavender (EDTA) or pink (K_2EDTA).

Synonyms:

- Anti-Platelet Antibodies
- Cell-Bound Platelet Antibody Test
- Platelet Associated Immunoglobulins (IgG & IgM)
- Direct Platelet Antibody
- LAB3811-VML
- LAB3811VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or pink (K_2EDTA).

Specimen Preparation:
Transport 4 mL whole blood. (Min: 1 mL)

Unacceptable Conditions:
Clotted, hemolyzed, frozen, or refrigerated specimens. Specimens older than 48 hours.

Storage/Transport Temperature:
CRITICAL ROOM TEMPERATURE.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: Unacceptable; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Specimens must be analyzed within 48 hours of collection. Required amount of blood may be dependent on platelet count.

ORDERING

Synonyms:

- Anti-Platelet Antibodies
- Cell-Bound Platelet Antibody Test
- Platelet Associated Immunoglobulins (IgG & IgM)
- Direct Platelet Antibody
- LAB3811-VML
- LAB3811VML

Ordering Recommendations:
Support the diagnosis of autoimmune thrombocytopenia (AITP).

Performed:
Sun-Sat

Methodology:
Qualitative Flow Cytometry

Reported:
2-3 days

Notes:
Detection of platelet-associated IgG and/or IgM may be used to separate thrombocytopenia of immune origin from nonimmune origin. Most patients with ITP have abnormally high levels of IgG associated with their platelets. Occasionally patients will have normal IgG levels but abnormally high levels of IgM. Dual staining and flow cytometric analysis ensures that only platelets are analyzed and relatively small volumes of blood are required. This assay does not distinguish between autoantibodies and alloantibodies, nor does it identify specific types of antiplatelet antibodies, such as those against HPA-1a. Refer to Platelet Antibodies, Indirect (ARUP test code 0051050).

RESULTS INTERPRETATION

Reference Interval:
IgG: Negative
IgM: Negative

Interpretive Data:

Negative (IgG & IgM): No excess antibodies were associated with the patient's platelets. An immune cause of thrombocytopenia is unlikely.
Positive (IgG and/or IgM): An increase in platelet associated immunoglobulin is noted. An immune cause of thrombocytopenia should be considered. However, many conditions can result in an increase in platelet associated antibodies; for example, IgM rheumatoid factor antibodies.
Strong Positive (IgG and/or IgM): A definite increase in platelet associated immunoglobulin is noted and an immune cause of thrombocytopenia should be considered. However, many conditions can result in an increase in platelet associated antibodies; for example, IgM rheumatoid factor antibodies.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Qualitative Flow Cytometry

ADDITIONAL INFORMATION

CPT Codes:

86023 x2

Section:

RF-ARUP

Remarks:

Specimens must be analyzed within 48 hours of collection. Required amount of blood may be dependent on platelet count.

Notes:

Detection of platelet-associated IgG and/or IgM may be used to separate thrombocytopenia of immune origin from nonimmune origin. Most patients with ITP have abnormally high levels of IgG associated with their platelets. Occasionally patients will have normal IgG levels but abnormally high levels of IgM. Dual staining and flow cytometric analysis ensures that only platelets are analyzed and relatively small volumes of blood are required. This assay does not distinguish between autoantibodies and alloantibodies, nor does it identify specific types of antiplatelet antibodies, such as those against HPA-1a. ARUP Laboratories

FULL VIEW

Collect:

Lavender (EDTA) or pink (K_2EDTA).

Specimen Preparation:

Transport 4 mL whole blood. (Min: 1 mL)

Unacceptable Conditions:

Clotted, hemolyzed, frozen, or refrigerated specimens. Specimens older than 48 hours.

Stability (from collection to initiation):

Ambient: 48 hours; Refrigerated: Unacceptable; Frozen: Unacceptable

Storage/Transport Temperature:

CRITICAL ROOM TEMPERATURE.

Synonyms:

- Anti-Platelet Antibodies
- Cell-Bound Platelet Antibody Test
- Platelet Associated Immunoglobulins (IgG & IgM)
- Direct Platelet Antibody
- LAB3811-VML
- LAB3811VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

2-3 days

Ordering Recommendations:

Support the diagnosis of autoimmune thrombocytopenia (AITP).

Interpretive Data:

Negative (IgG & IgM): No excess antibodies were associated with the patient's platelets. An immune cause of thrombocytopenia is unlikely.
Positive (IgG and/or IgM): An increase in platelet associated immunoglobulin is noted. An immune cause of thrombocytopenia should be considered. However, many conditions can result in an increase in platelet associated antibodies; for example, IgM rheumatoid factor antibodies.
Strong Positive (IgG and/or IgM): A definite increase in platelet associated immunoglobulin is noted and an immune cause of thrombocytopenia should be considered. However, many conditions can result in an increase in platelet associated antibodies; for example, IgM rheumatoid factor antibodies.

Platelet Count

LAB301

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- PLT, Platelet count
- LAB301-VML
- LAB301VML

Turn Around Time:
Stat: 1 hour

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Collect to fill line on tube, gently invert back and forth immediately for blood to mix with EDTA anitcoagulant to prevent clotting. Do not draw above IV line. (Min 1.0 mL)

Pediatric Collection:
Pediatric: 160 microliters minimum

Storage/Transport Temperature:
Refrigerated preferred, or ambiant temperature, DO NOT FREEZE

Performed:
Daily

Stability:
Room temperature: 8 hrs, 2 to 8 degrees C: 24 hrs

Specimen:
Whole Blood

Alternate Specimen:
Yellow tube (ACD-A) with lab approval, must be collected to fill line and mixed immediatley with antocoagulant

ORDERING

Ordering Indicators:
ITP, Trauma

Platelet Function Screen

LAB318

ORDERING INFO

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Synonyms:

- LAB318, PFS, PFA-100
- LAB318-VML
- LAB318VML

Turn Around Time:

4 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. Samples must be hand carried to the lab. The samples cannot be sent via the pneumatic tube

Pediatric Collection:

One 2.7 mL light blue tube (3.2% Sodium Citrate)

Storage/Transport Temperature:

Ambient: (15-25°C)

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours

Specimen:

Citrated whole blood

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:
N/A

Synonyms:

- LAB318, PFS, PFA-100
- LAB318-VML
- LAB318VML

Performed:
Daily

Turn Around Time:
4 hours

Methodology:
Aperture closure

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Collagen/ADP: 60-100 seconds Collagen/Epinephrine: 80 - 150 seconds

Interpretive Data:
Hematocrit < 25% and/or platelet counts < 100,000/mmc will result in prolongations of the ADP and EPI closure times. Platelet inhibiting agents such as aspirin, NISADS, P2Y12 inhibitors, and anti-glycoprotein IIb/IIIa direct affect platelet function.

Methodology:
Aperture closure

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Free hemoglobin from the lysis of red cells may affect the assay due to decrease hematocrit and the release of ADP from the lysed red cells.

Components:
N/A

PLEURAL FLUID, THORACENTESIS FLUID, MISC. FLUID CYTOLOGY

plfl, thor, flu

ORDERING INFO

Collect:
Clean specimen container.

Synonyms:

- Pleural fluid, Thoracentesis fluid, Miscellaneous site fluid

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container.

Specimen Preparation:
1. Collect specimen in a clean specimen container (min 1 mL). 2.Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: 100ml is optimal)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours. Some specimens may have fixative added if specimen cannot be delivered within 2 hours and cannot be Refrigerated: (2-8°C) during transport. Call lab for assistance at 615-322-2721.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Fresh body cavity fluid specimen in a clean sample container.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Body cavities in the absence of disease contain only a small amount of fluid. The presence of larger amounts in quantities for aspiration indicates a pathologic condition. Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc. 1U/mL of Heparin may be added if bloody.

Synonyms:

- Pleural fluid, Thoracentesis fluid, Miscellaneous site fluid

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Poliovirus (Types 1, 3) Antibodies

LAB5852

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plain Red.

Synonyms:

- Enterovirus; Poliovirus (1,3) Abs
- Poliovirus (Types 1,3) Abs
- Poliovirus (Types 1,3) Antibodies
- Poliovirus 1, 3 Antibody (Immune Status)
- Poliovirus Antibody, Neutralization
- Poliovirus Antibodies
- Enterovirus
- Poliovirus (1,3) Abs
- LAB5852-VML
- LAB5852VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Plasma. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon-Fri

ORDERING

Synonyms:

- Enterovirus; Poliovirus (1,3) Abs
- Poliovirus (Types 1,3) Abs
- Poliovirus (Types 1,3) Antibodies
- Poliovirus 1, 3 Antibody (Immune Status)
- Poliovirus Antibody, Neutralization
- Poliovirus Antibodies
- Enterovirus
- Poliovirus (1,3) Abs
- LAB5852-VML
- LAB5852VML

Ordering Recommendations:
Detect neutralizing antibodies to poliovirus (types 1 and 3).

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Serum Neutralization

Reported:
6-12 days

RESULTS INTERPRETATION

Reference Interval:

Less than 1:10	No detectable poliovirus antibodies.
1:10 or greater	Antibody to poliovirus detected, which may represent prior immunization or current or past infection.

Interpretive Data:
The presence of neutralizing antibodies against poliovirus implies immunity. The serum neutralization test is serotype specific. Antibodies against one type does not indicate immunity against the other type.

Reference interval applies to Poliovirus Antibodies Types 1 and 3.

Methodology:
Semi-Quantitative Serum Neutralization

Porphobilinogen (PBG), Urine

LAB1071

ORDERING INFO

Collect:
Random or 24-hour urine. Refrigerate 24-hour specimens during collection.

Synonyms:

- PBG, Quantitative
- Porphobilinogen
- Watson-Schwartz Test
- LAB1071-VML
- LAB1071VML

SPECIMEN REQUIREMENTS

Collect:
Random or 24-hour urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:
Protect from light. Transfer 8 mL aliquot from a random or well-mixed 24-hour collection to ARUP Amber Transport Tubes. (Min: 3.5 mL) Record total volume and collection time interval on transport tube and test request form.

Unacceptable Conditions:
Body fluids other than urine.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 4 days; Frozen: 1 month

Performed:
Mon-Fri

ORDERING

Synonyms:

- PBG, Quantitative
- Porphobilinogen
- Watson-Schwartz Test
- LAB1071-VML
- LAB1071VML

Ordering Recommendations:
Essential first-line test for suspected acute porphyria in adults. Use in determining metabolic response to IV hematin.

Performed:
Mon-Fri

Methodology:
Quantitative Ion Exchange Chromatography/Spectrophotometry

Reported:
1-4 days

Notes:
Appropriate test to rule out acute intermittent porphyria (AIP) and other acute attack types of porphyrias associated with neurologic and/or psychiatric symptoms.

RESULTS INTERPRETATION

Reference Interval:

<table>
<tr><th>Components</th><th>Reference Interval</th></tr>
<tr><td>Creatinine, Urine - per 24h</td><td>
<table>
<tr><th>Age</th><th>Male (mg/d)</th><th>Female (mg/d)</th></tr>
<tr><td>3-8 years</td><td>140-700</td><td>140-700</td></tr>
<tr><td>9-12 years</td><td>300-1300</td><td>300-1300</td></tr>

<tr><td>Porphobilinogen (PBG), Urine -per volume</td><td>0.0-8.8 µmol/L</td></tr>
</table>

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Porphyrins, Fecal

LAB3176

ORDERING INFO

Collect:
Random stool.

Synonyms:

- Coproporphyrinl
- Coproporphyrins
- Isocoproporphyrins
- Protoporphyrin
- LAB3176-VML
- LAB3176VML

SPECIMEN REQUIREMENTS

Collect:
Random stool.

Specimen Preparation:
Protect from light during collection, storage, and shipment. Freeze specimen and wrap in foil immediately after collection. Transport 5 g stool. (Min: 1 g)

Unacceptable Conditions:
Complete timed collections (24-72 hour). Specimens stored in one gallon cans or other large containers. Liquid stool.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 3 weeks

Performed:
Mon

ORDERING

Synonyms:

- Coproporphyrinl
- Coproporphyrins
- Isocoproporphyrins
- Protoporphyrin
- LAB3176-VML
- LAB3176VML

Ordering Recommendations:
Distinguish among acute intermittent porphyria (AIP), variegate porphyria (VP), and hereditary coproporphyria (HCP).

Performed:
Mon

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
2-8 days

Notes:
Bacterial modification of fecal porphyrins is extensive. The recommended specimen for uroporphyrin and coproporphyrin is urine (random or 24-hour). Refer to Porphyrins, Fractionation & Quantitation, Urine (ARUP test code 2002058). The recommended specimen for protoporphyrin is serum. Refer to Porphyrins, Serum Total (ARUP test code 0080429).

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Coproporphyrin, Feces	0-45 nmol/g dry weight
Protoporphyrin, Feces	0-100 nmol/g dry weight

Interpretive Data:

This test is useful for differentiation of acute porphyrias following a positive porphobilinogen (PBG), or diagnosis or strong suspicion of acute porphyria. Fecal porphyrin excretion usually is not elevated in acute intermittent porphyria (AIP), but massive increases of fecal coproporphyrin are seen in hereditary coproporphyria (HCP). Fecal protoporphyrin and coproporphyrin excretion is increased in variegate porphyria (VP).
This fecal porphyrins assay is not a screening test. Total porphyrins are not measured.
For additional information, access the Porphyrias topic in ARUP Consult (arupconsult.com).

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Porphyrins, Fractionation and Quantitation, Urine

LAB3239

ORDERING INFO

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Synonyms:

- Porphyria Cutanea Tarda (PCT)
- Coproporphyrin
- Heptacarboxyl Porphyrin
- Hexacarboxyl Porphyrin
- Uroporphyrin
- Pentacarboxyl Porphyrin
- Porphyrins, Fractionated, Quantitative, 24-Hour
- LAB3239-VML
- LAB3239VML

SPECIMEN REQUIREMENTS

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:
Protect from light. Transfer 4 mL aliquot of urine to an ARUP Amber Transport Tube. (Min: 2 mL) Record total volume and collection time interval on transport tube and test request form.

Unacceptable Conditions:
Body fluids other than urine.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 4 days; Frozen: 1 month

Performed:
Mon-Fri

ORDERING

Synonyms:

- Porphyria Cutanea Tarda (PCT)
- Coproporphyrin
- Heptacarboxyl Porphyrin
- Hexacarboxyl Porphyrin
- Uroporphyrin
- Pentacarboxyl Porphyrin
- Porphyrins, Fractionated, Quantitative, 24-Hour
- LAB3239-VML
- LAB3239VML

Ordering Recommendations:
Evaluate cutaneous photosensitivity to exclude or include porphyria cutanea tarda (PCT).

Performed:
Mon-Fri

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
1-5 days

Notes:
Urine porphyrins are useful for the evaluation of cutaneous photosensitivity to exclude porphyria cutanea tarda (PCT). Evaluation of neurologic and/or psychiatric symptoms associated with acute porphyrias such as acute intermittent porphyria (AIP) requires urine porphobilinogen (PBG) testing. Refer to Porphobilinogen (PBG), Urine (ARUP test code 0080260).

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval		
Creatinine, Urine - per 24h	**Age**	**Male (mg/d)**	**Female (mg/d)**
	3-8 years	140-700	140-700
	9-12 years	300-1300	300-1300
	13-17 years	500-2300	400-1600
	18-50 years	1000-2500	700-1600
	51-80 years	800-2100	500-1400
	81 years and older	600-2000	400-1300
Uroporphyrin - ratio to CRT	0-4 µmol/mol CRT		
Heptacarboxylate - ratio to CRT	0-2 µmol/mol CRT		
Coproporphyrin I - ratio to CRT	0-6 µmol/mol CRT		
Coproporphyrin III - ratio to CRT	0-14 µmol/mol CRT		

Interpretive Data:

Results are normalized to creatinine concentration and reported as a ratio of amounts (micromoles of porphyrin/moles of creatinine).

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Porphyrins, Total, Plasma or Serum

LAB123

ORDERING INFO

Collect:
Green (heparin), lavender (EDTA), or plain red

Synonyms:

- Coproporphyrin
- Protoporphyrin
- Variegate Porphyria Porphyrin
- VP Porphyrin
- LAB123-VML
- LAB123VML

SPECIMEN REQUIREMENTS

Collect:
Green (heparin), lavender (EDTA), or plain red

Specimen Preparation:
CRITICAL: Protect from light during collection, storage, and shipment. Separate plasma or serum from cells within 1 hour of collection. Transfer 2 mL plasma or serum to an ARUP Amber Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Body fluids other than plasma or serum. Frozen whole blood. Hemolyzed specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 14 days; Frozen: 3 month

Performed:
Sun, Tue, Thu

ORDERING

Synonyms:

- Coproporphyrin
- Protoporphyrin
- Variegate Porphyria Porphyrin
- VP Porphyrin
- LAB123-VML
- LAB123VML

Ordering Recommendations:
Monitor porphyria cutanea tarda (PCT). Confirm diagnosis of suspected variegate porphyria (VP) and erythropoietic protoporphyria (EPP).

Performed:
Sun, Tue, Thu

Methodology:
Quantitative Fluorometry

Reported:
1-4 days

Notes:
Useful for evaluation of cutaneous photosensitivity to rule out porphyrin disorders, particularly erythropoietic protoporphyria. Urine is the best specimen for evaluation of suspected porphyria cutanea tarda (PCT), but monitoring of PCT with plasma or serum is an acceptable practice. Evaluation of neurologic and/or psychiatric symptoms associated with suspected acute porphyria (such as acute intermittent porphyria) requires Porphobilinogen (PBG), Urine (ARUP test code 0080260).

Specimens from patients with suspected erythropoietic protoporphyria should be carefully protected from exposure to light. Protoporphyrin is extremely light sensitive, whereas uroporphyrin and coproporphyrin are much less sensitive.

RESULTS INTERPRETATION

Reference Interval:
0-15 nmol/L

Methodology:
Quantitative Fluorometry

ADDITIONAL INFORMATION

- Noxafil
- noxafil blood level
- LAB3813-VML
- LAB3813VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Tue, Thu, Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 15, 2011

Therapeutic Range (trough): Greater than 0.7 µg/mL

Interpretive Data:
Posaconazole is a triazole antifungal drug indicated to treat invasive aspergillus and candidiasis infections. The therapeutic range is based on serum, predose (trough) draw collection at steady-state concentration. The pharmacokinetics of posaconazole are influenced by drug-drug interactions when coadministered with drugs metabolized by UDP-glucuronosyltransferase. Posaconazole is also an inhibitor of cytochrome P450 3A4 enzyme. Adverse effects may include fever, nausea, vomiting, diarrhea, cardiovascular disorders, and liver toxicity.

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

ADDITIONAL INFORMATION

CPT Codes:
80187

Section:
RF-ARUP

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:
Plain Red, Lavender (EDTA), or Green (Sodium or Lithium Heparin).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube and freeze. (Min: 0.6 mL)

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration. Blood levels may be affected by other concurrent medications, patient conditions, fat intake at dosing, and other factors.

Unacceptable Conditions:
Whole blood. Gel separator tubes, Light Blue (citrate), or Yellow (SPS or ACD solution).

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 48 hours; Frozen: 6 months

Storage/Transport Temperature:
Frozen.

Potassium, Fecal

LAB577

ORDERING INFO

Collect:
24-hour or random stool.

Synonyms:

- Electrolytes, Feces
- LAB577-VML
- LAB577VML

SPECIMEN REQUIREMENTS

Collect:
24-hour or random stool.

Specimen Preparation:
Transfer a 5 g stool to an unpreserved stool transport vial (ARUP Supply #40910). Available online through eSupply using ARUP Connect(TM) or contact Client Services at (800) 522-2787. (Min: 1 g) Mix 24-hour collection well. Do not add saline or water to liquefy specimen.

Unacceptable Conditions:
Formed or viscous stool.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: 2 weeks; Frozen: 6 months

Performed:
Sun-Sat

Potassium, Plasma or Serum

LAB114

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- K, Potassium Blood, Potassium Level, LAB114
- LAB114-VML
- LAB114VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should avoid exercise of arm or hand before and during collection.

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.2 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Room Temperature: 15° to 25°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 7 days; 2° to 8°C: 7 days; Frozen: 1 year

Specimen:
Plasma or Serum

Alternate Specimen:
Gold (Clot Activator with Gel)

SPECIMEN REQUIREMENTS

Collect:
Serum Pre-dose (Trough) Draw - At a Steady State Concentration or Plasma Pre-dose (Trough) Draw - At a Steady State Concentration in Plain Red, Lavender (K_2EDTA), Lavender (K_3EDTA), or Pink (K_2EDTA).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Citrated Plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 month; Refrigerated: 1 month; Frozen: 2 months

Performed:
Wed, Sat

ORDERING

Synonyms:

- Lyrica
- LAB3814-VML
- LAB3814VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Wed, Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Therapeutic Range	Not well established
Toxic	Not well established

Interpretive Data:
The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Therapeutic and toxic ranges are not well established. Proposed Dose-Related Range: 2 - 10 ug/mL. Adverse effects may include peripheral edema, allergic reactions, dizziness and somnolence.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:
Serum separator tube. Also acceptable: Plain red, lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Specimen Preparation: Separate serum or plasma cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum or plasma in two ARUP Standard Transport Tubes and freeze immediately. (Min: 0.25 mL/container)

Unacceptable Conditions:
Refrigerated or room temperature specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 6 months

Storage/Transport Temperature:
CRITICAL FROZEN. Additional specimens must be submitted when multiple tests are ordered.

Prekallikrein Screen

LAB1114

ORDERING INFO

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Synonyms:

- LAB1114, Pre, Fletcher Factor, PRE SCR
- LAB1114-VML
- LAB1114VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:
The prekallikreinin screen provides insight into the etiology of a prolonged partial thromboplastin time (PTT) when other factors have been reported as normal. Note: decreased prekallikrein is not associated with a bleeding phenotype.

Synonyms:

- LAB1114, Pre, Fletcher Factor, PRE SCR
- LAB1114-VML
- LAB1114VML

Performed:
Daily

Turn Around Time:
1 - 3 days

Methodology:
Clotting

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
The result of the prekallirein screening assay indicates the patient does not have a prekallirein deficiency.

Interpretive Data:
Direct thrombin (IIa) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. The presence of a strong lupus anticoagulant may interfer with the assay. The presence of Hemlibra (emicizumab-kxwh) may cause a the initial PTT result to be normal.. (DOI: 10.1111/hae.13903)

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Performed daily from 7:00 AM to 4:00 PM. Sample must be received in the laboratory by 2:00 PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call (refer to Synergy for contact information).

Components:
N/A

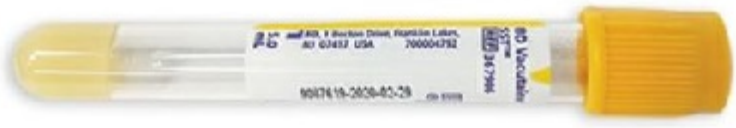
Procalcitonin, serum

LAB6117

ORDERING INFO

Collect:
Gold (Clot Activator with Gel)



Synonyms:

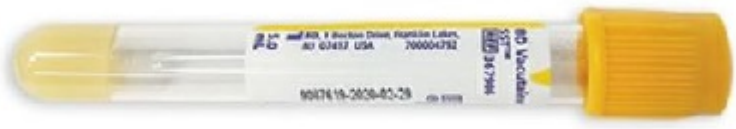
- LAB6117, PCT, Procal, PROCT
- LAB6117-VML
- LAB6117VML

Turn Around Time:
STAT: 90 minutes after receiving in lab Routine: 3 hours after receiving in lab

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Gold (Clot Activator with Gel)



Specimen Preparation:
Separate within 2 hours and store/ship at room temperature until delivery. (Minimum: 0.5 mL serum)

Pediatric Collection:
Gold microtainer (with gel)

Storage/Transport Temperature:
Room temperature

Performed:
Daily

Stability:
Ambient (15-25°C): 24 hours Refrigerated (2-8°C): 2 days

Specimen:
Serum

Alternate Specimen:
Red tube (no gel)

ORDERING

Ordering Indicators:
This test is used as an aid in assessing the cumulative 28-day risk of all-cause mortality for patients diagnosed with severe sepsis or septic shock in the Intensive Care Unit (ICU) or when obtained in the emergency department or other medical wards prior to ICU admission. This test is FDA-approved for the use of antibiotics stewardship.

Synonyms:

- LAB6117, PCT, Procal, PROCT
- LAB6117-VML
- LAB6117VML

Performed:
Daily

Turn Around Time:
STAT: 90 minutes after receiving in lab Routine: 3 hours after receiving in lab

Methodology:
Electrochemiluminescence immunoassay (ECLIA)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
=/< 0.25 ng/mL

Interpretive Data:
A PCT level that declines to less than 80% from the day that severe sepsis or septic shock was clinically diagnosed (Day 0) to four days after clinical diagnosis (Day 4) is associated with higher cumulative 28-day risk of all-cause mortality than a decline of > 80%. Depending on the clinical background, a PCT concentration above 0.1 µg/L can indicate clinically relevant bacterial infection, requiring antibiotic treatment.

Methodology:
Electrochemiluminescence immunoassay (ECLIA)

Procollagen Type I Intact N-Terminal Propeptide

LAB3815

ORDERING INFO

Collect:
Serum separator tube or plain red. Collect all specimens at the same time of day; there is a diurnal variation of PINP and values are higher at night.

Synonyms:

- Procollagen Propeptide
- Procollagen Type 1 Intact N-Terminal Propeptide
- FPINT
- P1NP
- PINP
- Procollagen
- Procollagen Type I Intact N-Terminal Propeptide
- LAB3815-VML
- LAB3815VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plain red. Collect all specimens at the same time of day; there is a diurnal variation of PINP and values are higher at night.

Specimen Preparation:
Allow serum tube to sit for 15-20 minutes at room temperature for proper clot formation. Centrifuge and separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Plasma. Hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 5 days; Frozen: 2 months

Performed:
Thu

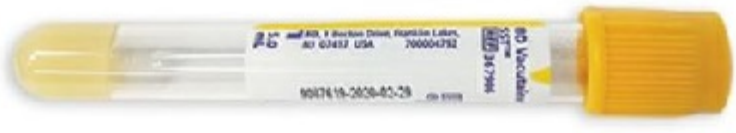
Prolactin, Serum

LAB531

ORDERING INFO

Collect:
Gold (Clot Activator with Gel)



Synonyms:

- PRL, Prolactin Blood, Prolactin Level, LAB531
- LAB531-VML
- LAB531VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Samples should not be taken from patients taking biotin until at least 8 hours following the last dose.

Collect:
Gold (Clot Activator with Gel)

Specimen Preparation:
Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.5 mL)

Pediatric Collection:
1 Gold Microtainer (Clot Activator with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 5 days; 2° to 8°C: 14 days; Frozen: 6 months

Specimen:
Serum

Alternate Specimen:
Red (No Gel)

Propafenone Quantitation, Serum or Plasma

LAB3816

ORDERING INFO

Collect:
Plain Red, Lavender (K_2 EDTA), Lavender (K_3 EDTA), or Pink (K_2 EDTA).

Synonyms:

- Rythmol
- LAB3816-VML
- LAB3816VML

SPECIMEN REQUIREMENTS

Collect:
Plain Red, Lavender (K_2 EDTA), Lavender (K_3 EDTA), or Pink (K_2 EDTA).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Separator tubes.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 1 month; Refrigerated: 1 month; Frozen: 15 months

Performed:
Varies

ORDERING

Synonyms:

- Rythmol
- LAB3816-VML
- LAB3816VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Varies

Methodology:
Qualitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
8-11 days

Notes:
Use of peak serum level is recommended for patient monitoring. Blood drug level drops rapidly, leading to many negative results at the trough. Peak serum concentration occurs 3 to 4 hours post dose.

RESULTS INTERPRETATION

Reference Interval:

Prostate Specific Antigen, Ultrasensitive

LAB3818

ORDERING INFO

Collect:
Serum Separator Tube (SST). Also acceptable: Green (lithium heparin), Lavender (K_2EDTA, or Pink (K_2EDTA).

Synonyms:

- Post Prostatectomy
- PSA, Third Generation
- Ultrasensitve PSA
- LAB3818-VML
- LAB3818VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST). Also acceptable: Green (lithium heparin), Lavender (K_2EDTA, or Pink (K_2EDTA).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Grossly hemolyzed specimens. Vaginal washings.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 5 days; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Post Prostatectomy
- PSA, Third Generation
- Ultrasensitve PSA
- LAB3818-VML
- LAB3818VML

Ordering Recommendations:
Use to monitor prostate cancer after radical prostatectomy. Do not use for initial prostate cancer screening; preferred test is Prostate Specific Antigen, Total (0070121) in conjunction with digital rectal exam.

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
0.00-4.00 ng/mL

Interpretive Data:

After radical prostatectomy, the reference interval is less than 0.05 ng/mL if there is no residual disease. In healthy individuals without prostatectomy, the reference interval is 4.00 ng/mL or less. Lower limit of detection is 0.01 ng/mL.

The Roche PSA electrochemiluminescent immunoassay is used. Results obtained with different test methods or kits cannot be used interchangeably. The Roche PSA method is approved for use as an aid in the detection of prostate cancer when used in conjunction with a digital rectal exam in individuals with a prostate 50 years and older. The Roche PSA is also indicated for the serial measurement of PSA to aid in the prognosis and management of prostate cancer patients. Elevated PSA concentrations can only suggest the presence of prostate cancer until biopsy is performed. PSA concentrations can also be elevated in benign prostatic hyperplasia or inflammatory conditions of the prostate. PSA is generally not elevated in healthy individuals or individuals with nonprostatic carcinoma.

Protein C Activity

LAB489

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB489, CAC, PC Act
- LAB489-VML
- LAB489VML

Turn Around Time:

1 - 6 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Twice per week - variable days

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

N/A

Patient Preparation:
Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Specimen:
Citrated platelet poor plasma.

Reasons for Rejection:
Incorrect tube type, clotted, incorrect fill volume, received on ice, grossly hemolyzed, grossly icteric, grossly lipemic. Whole blood > 8 hours after collection. Thawed plasma aliquots.

Components:
N/A

Stability:
Refrigerated (2-8°C): 8 hours, Frozen (-70°C): 1 month

Storage/Transport Temperature:
Ambient: (15-25°C) for Light blue tube, must be received within 8 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 8 hours of collection.

Synonyms:

- LAB490, PCA, Protein C Antigen Total, PC Antigen
- LAB490-VML
- LAB490VML

Performed:
Once per week - variable days

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
7 days

Ordering Indicators:
N/A

Interpretive Data:
Therapeutic warfarin results in a decreased level of Protein C. Presence of Aprotinin in the sample will result in an under estimation of the Protein C level.

Reference Interval:
70 - 140%

Additional Information:
Request for in-patient testing must be approved by the Coagulation Medical Director on-call. (Refer to Synergy for contact informtation.) Request for testing can be submitted via the following link: redcap.link/misc-coag.

Methodology:
ELISA

Section:
Coagulation

Protein S Activity

LAB491

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB491, PS, PS Act
- LAB491-VML
- LAB491VML

Turn Around Time:

1 - 6 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Twice per week - variable days

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB491, PS, PS Act
- LAB491-VML
- LAB491VML

Performed:
Twice per week - variable days

Turn Around Time:
1 - 6 days

Methodology:
Clotting

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
55 - 123%

Interpretive Data:
Protein S Activity is naturally reduced during pregnancy, inflammation, and in patients receiving warfarin. Direct IIa (thrombin) and both direct and iIndirect anti-Xa inhibitors interfere with the assay resulting in an overestimation of protein S activity. Factor VIII levels > 150% may affect the assay and results should be interpreted with caution. The presence of a strong Lupus Anticoagulant may affect the assay and clinical correlation is advised. The presence of Hemlibra (emicizumab) will affect the test and result in an overestimation of protein S activity.

Methodology:
Clotting

Proteinase 3 (PR3) IgG, serum

LAB3465

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB3465, PR3, Anti-PR3
- LAB3465-VML
- LAB3465VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used to evaluate patients with signs and symptoms of ANCA-associated vasculitis.

Synonyms:

- LAB3465, PR3, Anti-PR3
- LAB3465-VML
- LAB3465VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
PR3 IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A Positive results of PR3 is indicative for granumatosis with polyangiitis (GPA, formerly known as Wegener granulomatosis). A negative result significantly diminishes the likelihood that a patient has GPA.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Additional Information:
Anti-PR3 is included in the ANCA test panel. It should not be ordered alone unless the patient has previously tested positive for anti-PR3.

Components:
PR3 IgG

Prothrombin (F2) c.*97G>A (G20210A) Mutation Analysis, Whole blood

LAB3041

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB3041, Factor II, PT2
- LAB3041-VML
- LAB3041VML

Turn Around Time:
10 days

SPECIMEN REQUIREMENTS

Patient Preparation:
Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood)

Pediatric Collection:
Two Lavender microtainers (EDTA)

Storage/Transport Temperature:
Ambient (15-25°C) or Refrigerated (2-8°C)

Performed:
Tuesday

Stability:
EDTA or Sodium Citrate: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days

Specimen:
Whole blood

Alternate Specimen:
Light blue tube (Sodium Citrate)

ORDERING

Ordering Indicators:
Used to assess individuals at risk of or presenting with venous thromboembolism (VTE).

Synonyms:

- LAB3041, Factor II, PT2
- LAB3041-VML
- LAB3041VML

Performed:
Tuesday

Turn Around Time:
10 days

Methodology:
Direct detection of F2 variant c.*97G>A (G20210A) by Taqman® SNP genotyping assay; Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
The F2 variant is thought to increase the stability of F2 mRNA, increasing levels of prothrombin 30% above normal in heterozygotes and to 70% above normal in homozygotes and consequently increasing levels of thrombin.

Methodology:
Direct detection of F2 variant c.*97G>A (G20210A) by Taqman® SNP genotyping assay; Laboratory Developed Test

Lavendar tube (EDTA)

Specimen Preparation:
Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood)

Pediatric Collection:
Two Lavender microtainers (EDTA)

Preferred Collection Volume:
4 mL whole blood

Alternate Specimen:
Light blue tube (Sodium Citrate)

Patient Preparation:
Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Specimen:
Whole blood

Reasons for Rejection:
Client will be notified by Molecular Diagnostics Lab if specimen is rejected.

Components:
N/A

Stability:
EDTA or Sodium Citrate: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days

Storage/Transport Temperature:
Ambient (15-25°C) or Refrigerated (2-8°C)

Synonyms:

- LAB3041, Factor II, PT2
- LAB3041-VML
- LAB3041VML

Performed:
Tuesday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
10 days

Ordering Indicators:
Used to assess individuals at risk of or presenting with venous thromboembolism (VTE).

Interpretive Data:
The F2 variant is thought to increase the stability of F2 mRNA, increasing levels of prothrombin 30% above normal in heterozygotes and to 70% above normal in homozygotes and consequently increasing levels of thrombin.

Reference Interval:
Not detected

Additional Information:
Laboratory Developed Test

Methodology:
Direct detection of F2 variant c.*97G>A (G20210A) by Taqman® SNP genotyping assay; Laboratory Developed Test

Prothrombin Antibody, IgG

LAB3817

ORDERING INFO

Collect:
Serum separator tube or lt. blue (sodium citrate).

Synonyms:

- Prothrombin IgG
- LAB3817-VML
- LAB3817VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or lt. blue (sodium citrate).

Specimen Preparation:
Transport 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Mon

ORDERING

Synonyms:

- Prothrombin IgG
- LAB3817-VML
- LAB3817VML

Ordering Recommendations:
Preferred second-line test when seronegative antiphospholipid syndrome (APS) is strongly suspected. Order incrementally or concurrently with other noncriteria antiphospholipid antibody tests.

Performed:
Mon

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
Effective 5/21/2018
Less than 20 Units

Interpretive Data:
IgG antibodies to prothrombin may be a risk factor for either venous or arterial thrombosis in antiphospholipid syndrome (APS). Strong clinical correlation is recommended in the absence of lupus anticoagulant, IgG and/or IgM cardiolipin and/or beta2 glycoprotein antibodies.

If results are positive, repeat testing with two or more specimens drawn at least 12 weeks apart to demonstrate persistence of antibodies.

Results should not be used alone for diagnosis and must be interpreted in light of APS-specific clinical manifestations and/or other criteria phospholipid antibody tests.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Prothrombin Time

LAB320

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB320, PT / INR, PT
- LAB320-VML
- LAB320VML

Turn Around Time:

2 hours once received into lab

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 24 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within two hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 24 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 24 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB320, PT / INR, PT
- LAB320-VML
- LAB320VML

Performed:
Daily

Turn Around Time:
2 hours once received into lab

Methodology:
Clotting

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
11.9 - 14.5 seconds

Interpretive Data:
Direct anti-IIa (thrombin) inhibitors, indirect Xa inhibitors (UFH > 1.0 IU/ml and LMWH > 1.5 IU/mL) and indirect Xa inhibitors may interfer with the assay and prolong the clotting time.

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:

PSA Diagnostic

LAB116

ORDERING INFO

Collect:
Gold (Clot Activator with Gel)

Synonyms:

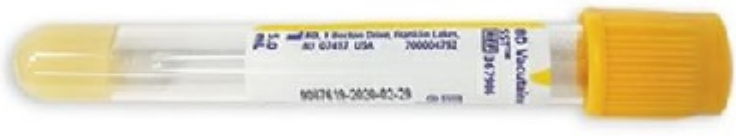
- PSA, Prostate Specific Antigen, LAB116
- LAB116-VML
- LAB116VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient results determined by assays using different manufacturers for methods may not be comparable.

Collect:
Gold (Clot Activator with Gel)



Specimen Preparation:
Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.5 mL)

Pediatric Collection:
2 Gold Microtainers (Clot Activator with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 2° to 8°C: 1 day

Specimen:
Serum

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
PSA is used to assist in diagnosis and monitoring of prostate cancer. When used as an initial screening test, there is no universally accepted normal range for PSA.

Synonyms:

- PSA, Prostate Specific Antigen, LAB116
- LAB116-VML
- LAB116VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Abbott Chemiluminescent Immunoassay

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
None: Please refer to comment in "Interpretive Data"

Interpretive Data:
PSA is used to assist in diagnosis and monitoring of prostate cancer. While there is no universally accepted normal range for PSA when used as an initial screening test, a PSA higher than 3 ng/mL is typically considered elevated, based on clinical studies and national guidelines (J Urol. 2023;210(1):45-53; J Natl Compr Canc Netw. Early Detection of Prostate Cancer Version 2.2023. https://www.nccn.org/professionals/physician_gls/pdf/prostate_detection.pdf). However, the PSA value should be interpreted in light of factors such as age, race, family history of prostate cancer, digital rectal examination result, prostate volume and result of prior prostate biopsy. Nomograms, such as the PBCG calculator, may be helpful in calculating the risk of clinically significant prostate cancer based on these factors (https://riskcalc.org/ExtendedPBCG/) (BMC Med Res Methodol 2022;22(1):200).

Methodology:
Abbott Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Chemistry

Alternate Specimen:
N/A

Additional Information:
Specimens which may be tested for Free PSA should be removed from the clot w/in 3 hours. If testing will be delayed more than 24 hours, specimens should be removed from the clot, serum separator and stored frozen.

Early Detection of Prostate Cancer Version 2.2023. https://www.nccn.org/professionals/physician_gls/pdf/prostate_detection.pdf). However, the PSA value should be interpreted in light of factors such as age, race, family history of prostate cancer, digital rectal examination result, prostate volume and result of prior prostate biopsy. Nomograms, such as the PBCG calculator, may be helpful in calculating the risk of clinically significant prostate cancer based on these factors (https://riskcalc.org/ExtendedPBCG/) (BMC Med Res Methodol 2022;22(1):200).

Methodology:
Abbott Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Chemistry

Alternate Specimen:
N/A

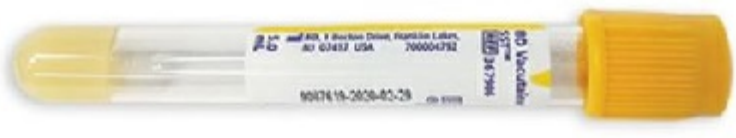
Additional Information:
Specimens which may be tested for Free PSA should be removed from the clot w/in 3 hours. If testing will be delayed more than 24 hours, specimens should be removed from the clot, serum separator and stored frozen.

Components:
PSA, Reflex; PSA, Free Rfx (if indicated); PSA, PCT Free, Rfx (if indicated)

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Gold (Clot Activator with Gel)



Specimen Preparation:
Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.5 mL)

Pediatric Collection:
2 Gold Microtainers (Clot Activator with Gel)

Preferred Collection Volume:
Fill to Indicator Line

Alternate Specimen:
N/A

Patient Preparation:
Patient results determined by assays using different manufacturers for methods may not be comparable.

Specimen:
Serum

Reasons for Rejection:
Hemolysis, improper collection, QNS, sample outside of stability limits

Components:
PSA, Reflex; PSA, Free Rfx (if indicated); PSA, PCT Free, Rfx (if indicated)

Stability:
After separation from cells: 2° to 8°C: 1 day

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Synonyms:

- PSR, PSA, Total w/Reflex Free PSA, TPSAR, Prostate Specific Antigen, LAB4157
- LAB4157-VML
- LAB4157VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Ordering Indicators:
PSA is used to assist in diagnosis and monitoring of prostate cancer. When used as an initial screening test, there is no universally accepted normal range for PSA.

Interpretive Data:
PSA is used to assist in diagnosis and monitoring of prostate cancer. While there is no universally accepted normal range for PSA when used as an initial screening test, a PSA higher than 3 ng/mL is typically considered elevated, based on clinical studies and national guidelines (J Urol. 2023;210(1):45-53; J Natl Compr Canc Netw. Early Detection of Prostate Cancer Version 2.2023. https://www.nccn.org/professionals/physician_gls/pdf/prostate_detection.pdf). However, the PSA value should be interpreted in light of factors such as age, race, family history of prostate cancer, digital rectal examination result, prostate volume and result of prior prostate biopsy. Nomograms, such as the PBCG calculator, may be helpful in calculating the risk of clinically significant prostate cancer based on these factors (https://riskcalc.org/ExtendedPBCG/) (BMC Med Res Methodol 2022;22(1):200).

Pseudocholinesterase, Dibucaine Inhibition

LAB3819

ORDERING INFO

Collect:
Serum separator tube, green (sodium or lithium heparin), lavender (EDTA), or pink (K_2EDTA).

Synonyms:

- Dibucaine Number
- Serum Cholinesterase
- Butyrylcholinesterase
- Cholinesterase
- Cholinesterase, Serum
- Dibucaine
- Dibucaine Inhibition
- Serum Pseudocholinesterase
- LAB3819-VML
- LAB3819VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Specimen must be drawn prior to surgery or more than two days following surgery. Do not draw in recovery room.

Collect:
Serum separator tube, green (sodium or lithium heparin), lavender (EDTA), or pink (K_2EDTA).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transport 1 mL serum or plasma. (Min: 0.25 mL)

Unacceptable Conditions:
Lt. blue (sodium citrate) or gray (oxalate/fluoride). Whole blood.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 4 hours; Refrigerated: 1 week; Frozen: 3 months

Performed:
Mon-Fri

ORDERING

Synonyms:

- Dibucaine Number
- Serum Cholinesterase
- Butyrylcholinesterase
- Cholinesterase
- Cholinesterase, Serum
- Dibucaine
- Dibucaine Inhibition
- Serum Pseudocholinesterase
- LAB3819-VML
- LAB3819VML

Ordering Recommendations:
Order to detect increased sensitivity in individuals who experience prolonged paralysis following succinylcholine or mivacurium administration.

Performed:
Mon-Fri

Methodology:
Quantitative Enzymatic Assay

Reported:
1-5 days

Notes:
Patients with acute or chronic liver disease, organophosphate poisoning, chronic renal disease, in late stages of pregnancy, or on estrogen therapy may have markedly decreased PChE activities.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Pseudocholinesterase, Total	2,900-7,100 U/L
Dibucaine Number	Greater than or equal to 80

Interpretive Data:

The dibucaine number (DN) is the percent of pseudocholinesterase (PChE) enzyme activity that is inhibited by dibucaine. Together, the DN and the PChE enzyme activity results can help to identify individuals at risk for prolonged paralysis following the administration of succinylcholine. Decreased PChE enzyme activity in conjunction with a DN less than 30 suggests high risk for prolonged paralysis. Normal to decreased PChE enzyme activity in conjunction with a DN 30-79 suggests variable risk. Although decreased PChE activity in conjunction with DN greater than or equal to 80 suggests variable risk, these results may be caused by exposure to organophosphates, the presence of liver disease, pregnancy, or circulating succinylcholine. Specimens should be collected 48 hours after the administration of succinylcholine.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Pyruvic Acid

LAB744

ORDERING INFO

Collect:
Green (Sodium or Lithium Heparin).

Synonyms:

- Pyruvate
- Pyruvic Acid
- LAB744-VML
- LAB744VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should be fasting and at complete rest. Patient should avoid any exercise of the arm or hand before or during collection. Draw the specimen without the use of a tourniquet or within three minutes of applying the tourniquet, but before releasing the tourniquet.

Collect:
Green (Sodium or Lithium Heparin).

Specimen Preparation:
If whole blood is collected in a syringe, transfer immediately to green (sodium or lithium heparin) tube before preparing specimen.
1) Immediately after blood is drawn, add exactly 1 mL whole blood to a chilled pyruvate collection tube containing 2 mL 8 percent (w/v) perchloric acid (ARUP supply #16567) available online through eSupply using ARUP Connect(TM) or contact Client Services at (800) 522-2787.
2) Mix well for 30 seconds then place in an ice bath for 10 minutes.
3) Centrifuge for 10 minutes at 1500 x g.
4) Decant 2 mL supernatant to an ARUP Standard Transport Tube and freeze. (Min: 1 mL)

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 days; Frozen: 4 weeks

Performed:
Sun-Sat

ORDERING

Synonyms:

- Pyruvate
- Pyruvic Acid
- LAB744-VML
- LAB744VML

Ordering Recommendations:
An isolated pyruvic acid concentration has little clinical value. Preferred test is Lactate to Pyruvate Ratio, Whole Blood (2007935), which reports concentrations for lactate, pyruvate, and L:P ratio on the same specimen.

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay

Reported:
1-2 days

Notes:
If less than 1 mL of blood is added to collection tube, pH of the supernatant will be too low for testing.

RESULTS INTERPRETATION

Reference Interval:
0.030-0.107 mmol/L (venous blood)

Methodology:
Quantitative Enzymatic Assay

ADDITIONAL INFORMATION

CPT Codes:
84210

Section:

Reported:
1-2 days

Ordering Recommendations:
An isolated pyruvic acid concentration has little clinical value. Preferred test is Lactate to Pyruvate Ratio, Whole Blood (2007935), which reports concentrations for lactate, pyruvate, and L:P ratio on the same specimen.

Reference Interval:
0.030-0.107 mmol/L (venous blood)

Methodology:
Quantitative Enzymatic Assay

Section:
RF-ARUP

CPT Codes:
84210

Notes:
If less than 1 mL of blood is added to collection tube, pH of the supernatant will be too low for testing.

Quantiferon-TB (Interferon-Gamma Detection), plasma

LAB6356

ORDERING INFO

Collect:
QFT Collection tubes (4)

Synonyms:

- LAB6356, QFT-TB, Quant Gold Plus
- LAB6356-VML
- LAB6356VML

Turn Around Time:
2 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
QFT Collection tubes (4)

Specimen Preparation:
Send to Virology Laboratory. DO NOT Refrigerate.

Pediatric Collection:
QFT Collection tubes (4)

Storage/Transport Temperature:
Ambient (15-25°C)

Performed:
Daily

Stability:
Ambient (15-25°C): 16 hours

Specimen:
Plasma

Alternate Specimen:
NA

ORDERING

Ordering Indicators:
This is an indirect test for the evaluation of Mycobacterium tuberculosis infection. The test is not recommended for diagnosing active tuberculosis infection.

Synonyms:

- LAB6356, QFT-TB, Quant Gold Plus
- LAB6356-VML
- LAB6356VML

Performed:
Daily

Turn Around Time:
2 - 3 Days

Methodology:
Chemiluminescent Immunoassay

Components:
TB1 Minus NIL, TB2 Minus Nil, Mitogen Minus Nil, Nil

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result indicates interferon-gamma (IFN-gamma) response to Mycobacterium tuberculosis antigens was detected, suggesting infection with M tuberculosis. Positive results in patients at low-risk for TB should be interpreted with caution and repeat testing on a new sample should be considered. False-positive results may occur in patients with prior infection with Mycobacterium marinum, Mycobacterium szulgai, or Mycobacterium kansasii. A negative result indicates IFN-gamma response to M. tuberculosis antigens was not detected. Latent infection with M tuberculosis is unlikely. A single negative result does not exclude infection with M tuberculosis.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
NA

Additional Information:
NA

Components:
TB1 Minus NIL, TB2 Minus Nil, Mitogen Minus Nil, Nil

Quantitative Detection of BCR-ABL1, Major (p210), Whole Blood or Bone Marrow

LAB3025

ORDERING INFO

Collect:

PAXgene tube

Synonyms:

- LAB3025, B2A, BCRABL mRNA Detection, BCR/ABL1 p210
- LAB3025-VML
- LAB3025VML

Turn Around Time:

7 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

PAXgene tube

Specimen Preparation:

Call Molecular Diagnostics Laboratory at 615-343-8121 or VPLS at 1-800-551-5227 or 615-936-0510 for Paxgene tube and instructions. Fill completely to red indicator line and store at room temperature. (Min 0.5mL blood or bone marrow)

Pediatric Collection:

N/A

Storage/Transport Temperature:

PAXgene tube: Ambient (15-25°C), Lavender tube (EDTA): Refrigerated (2-8°C)

Performed:

1 - 2 days per week (variable days Monday - Friday)

Stability:

PAXgene: Ambient (15-25°C): 7 days; Lavender (EDTA): Refrigerated (2-8°C)C: 36 hours

Specimen:

Whole blood or bone marrow

Alternate Specimen:

Lavender tube (EDTA)

ORDERING

Ordering Indicators:

Intended for therapeutic monitoring and detection of minimal residual disease (MRD) in BCR::ABL1 major (p210) positive chronic myeloid leukemia (CML) or acute lymphoblastic leukemia/lymphoma (ALL).

Synonyms:

- LAB3025, B2A, BCRABL mRNA Detection, BCR/ABL1 p210
- LAB3025-VML
- LAB3025VML

Performed:

1 - 2 days per week (variable days Monday - Friday)

Turn Around Time:

7 days

Methodology:
Quantification of of BCR::ABL1 (p210) fusion transcripts is performed via reverse transcription-PCR (RT-PCR) in combination with real-time probe hydrolysis technology (TaqMan); Laboratory Developed Test.

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Undetected

Interpretive Data:
Quantitative assay for BCR::ABL1 (major transcript; p210); reported using % International Scale (% IS) and Major Response (MR) values.

Methodology:
Quantification of of BCR::ABL1 (p210) fusion transcripts is performed via reverse transcription-PCR (RT-PCR) in combination with real-time probe hydrolysis technology (TaqMan); Laboratory Developed Test.

Rapid HIV BBF Exposure, serum or plasma

LAB473

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB473, HRV, Rapid HRV, BBF Exposure
- LAB473-VML
- LAB473VML

Turn Around Time:
1 hour

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily, on a continuous basis

Stability:
Ambient (15-25°C): 2 days, Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA)

ORDERING

Ordering Indicators:
This test is used to determine the HIV status of a source patient for an employee blood or body fluid exposure.

Synonyms:

- LAB473, HRV, Rapid HRV, BBF Exposure
- LAB473-VML
- LAB473VML

Performed:
Daily, on a continuous basis

Turn Around Time:
1 hour

Methodology:
Immunochromatography

Components:
HIV Ag/Ab

RESULTS INTERPRETATION

Reference Interval:
Nonreactive

Interpretive Data:
A reactive result for antigen and/or antibody is suggestive of HIV infection. Specimens reactive to antibodies will be confirmed by HIV-1/2 differentiation assay. A nonreactive result does not rule out infection with HIV.

Methodology:
Immunochromatography

ADDITIONAL INFORMATION

Section:
TVC Core Lab

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA)

Additional Information:
A recommendation to order HIV-1 nucleic-acid testing on a separate specimen will be made for certain results. Antibody-reactive specimens are confirmed by HIV-1/HIV-2 differentiation assay. A negative result does not rule out infection with HIV.

Components:
HIV Ag/Ab

Reducing Substances - Fecal

LAB6122

ORDERING INFO

Collect:
Stool.

Synonyms:

- Stool reducing substances
- LAB6122-VML
- LAB6122VML

SPECIMEN REQUIREMENTS

Collect:
Stool.

Specimen Preparation:
Transfer 5 g stool to an unpreserved stool transport vial (ARUP Supply #40910) available online through eSupply using ARUP ConnectTM or contact ARUP Client Services at 800-522-2787. (Min: 1 g)

Unacceptable Conditions:
Diapers. Stool containing barium. Specimens in media or preservatives.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 2 week

Performed:
Sun-Sat

ORDERING

Synonyms:

- Stool reducing substances
- LAB6122-VML

Reptilase Time

LAB1136

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB1136, REP
- LAB1136-VML
- LAB1136VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Reptilase time can be useful in two clinical circumstances: (1) When there is concern for a functional defect in fibrinogen, (2) identifying heparin contamination as the cause or contributor to a prolonged PT, PTT and TT.

Synonyms:

- LAB1136, REP
- LAB1136-VML
- LAB1136VML

Performed:
Daily

Turn Around Time:
1 - 3 days

Methodology:
Clotting

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
15 - 25 seconds

Interpretive Data:
Direct thrombin (IIa) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. The presence of a strong lupus anticoagulant may interfer with the assay.

Methodology:
Clotting

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Performed daily from 7:00 AM to 4:00 PM. Sample must be received in the laboratory by 3:00 PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call (refer to Synergy for contact information).

Components:

Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 4 hours; Refrigerated: 1 week; Frozen: 3 months

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- RBP
- Retinol Binding Protein
- LAB3821-VML
- LAB3821VML

Performed:
Mon, Wed, Fri

Resulting Laboratory:
ARUP Laboratories

Reported:
1-4 days

Ordering Recommendations:
May be helpful as an indicator of malnutrition, acute and chronic hepatic disease, advanced chronic renal insufficiency, or cystic fibrosis. Assess nephrotic syndrome and protein-losing enteropathy.

Reference Interval:
3.0-6.0 mg/dL

Methodology:
Quantitative Nephelometry

Section:
RF-ARUP

CPT Codes:
83883

Rheumatoid Factor

LAB6059

ORDERING INFO

Collect:
Serum separator tube or plasma separator tube. Also acceptable: Green (lithium heparin), lavender or pink (K_2EDTA).

Synonyms:

- RA
- RF
- Rheumatoid Arthritis Factor
- LAB6059-VML
- LAB6059VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting specimen preferred.

Collect:
Serum separator tube or plasma separator tube. Also acceptable: Green (lithium heparin), lavender or pink (K_2EDTA).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Body Fluid (refer to Rheumatoid Factor, Body Fluid, ARUP test code 2003347). Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 8 days; Frozen: 3 months (should not be thawed more than once)

Performed:
Sun-Sat

ORDERING

Synonyms:

- RA
- RF
- Rheumatoid Arthritis Factor
- LAB6059-VML
- LAB6059VML

Ordering Recommendations:
Aids in the workup of suspected rheumatoid arthritis or undifferentiated inflammatory arthritides. Consider ordering this test in conjunction with Cyclic Citrullinated Peptide Antibody, IgG and IgA (3016632) to increase specificity and sensitivity. The preferred test is Rheumatoid Arthritis Panel (3016634).

Performed:
Sun-Sat

Methodology:
Quantitative Immunoturbidimetry

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
0-14 IU/mL

Methodology:
Quantitative Immunoturbidimetry

Ribosomal P Protein Antibody

LAB1399

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Anti-Ribosome P Antibodies
- Ribosomal P Antibodies
- Ribosome Antibody
- rRNP
- LAB1399-VML
- LAB1399VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Plasma or other body fluids. Bacterially contaminated or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Anti-Ribosome P Antibodies
- Ribosomal P Antibodies
- Ribosome Antibody
- rRNP
- LAB1399-VML
- LAB1399VML

Ordering Recommendations:
May be useful to detect central nervous system systemic lupus erythematosus (SLE), which is somewhat rare, or renal involvement in SLE.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Multiplex Bead Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Ribosome P Antibody, IgG	0-40 AU/mL

Interpretive Data:
Autoantibodies reacting with cytoplasmic ribosomes are highly specific for systemic lupus erythematosus. Ribosomal-P antibodies are found in approximately 12% of patients with systemic lupus erythematosus (SLE) and in 90% of patients with lupus psychosis; titers often increase more than fivefold during and before active phases of psychosis.

Component	Interpretation
Ribosomal P Protein Antibody	29 AU/mL or less Negative 30-40 AU/mL Equivocal 41 AU/mL or greater Positive

Rickettsia rickettsii (Rocky Mountain Spotted Fever) IgG and IgM, serum

LAB6398

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB6398, RMSF, Rocky Mountain Spotted Fever
- LAB6398-VML
- LAB6398VML

Turn Around Time:
1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Refrigerated (2-8°C): 5 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used as an aid in the diagnosis of spotted fever group rickettsial infection.

Synonyms:

- LAB6398, RMSF, Rocky Mountain Spotted Fever
- LAB6398-VML

Risperidone and Metabolite, Serum or Plasma

LAB3822

ORDERING INFO

Collect:
Plain Red. Also acceptable: Lavender (EDTA) or Pink (K_2EDTA).

Synonyms:

- 9-Hydroxyrisperidone
- risperdal blood level
- Risperdal{R}
- risperidone blood level
- LAB3822-VML
- LAB3822VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain Red. Also acceptable: Lavender (EDTA) or Pink (K_2EDTA).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 2 weeks; Refrigerated: 2 weeks; Frozen: 2 months

Performed:
Mon, Wed, Sat

Remarks:
N/A

ORDERING

Synonyms:

- 9-Hydroxyrisperidone
- risperdal blood level
- Risperdal{R}
- risperidone blood level
- LAB3822-VML
- LAB3822VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence. This test detects risperidone (parent) AND paliperidone (9-hydroxyrisperidone, metabolite). For paliperidone (9-hydroxyrisperidone) only, order Paliperidone, Serum or Plasma (2007949).

Performed:
Mon, Wed, Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:

Effective June 7, 2021

Therapeutic range (Risperidone)	20-60 ng/mL
Therapeutic range (9-hydroxyrisperidone (Paliperidone))	20-60 ng/mL
Toxic range (Risperidone and Metabolite)	Greater than 120 ng/mL

Interpretive Data:

The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Adverse effects to risperidone therapy may include headache, nausea, dizziness, tachycardia, orthostatic hypotension and dyskinesia.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Ristocetin Induced Platelet Aggregation (RIPA)

LAB3076

ORDERING INFO

Collect:

Four to six 2.7 mL light blue tubes (3.2% Sodium Citrate) and one Lavender tube (EDTA)

Synonyms:

- LAB3076, RIPA, RAG
- LAB3076-VML
- LAB3076VML

Turn Around Time:

2 - 10 days for interpretation.

SPECIMEN REQUIREMENTS

Patient Preparation:

Patient should not take over the counter medications for 10 days prior to testing. Patient should be fasting from midnight and they must arrive at Vanderbilt between 8:00 and 8:30 a.m. on the day of testing.

Collect:
Four to six 2.7 mL light blue tubes (3.2% Sodium Citrate) and one Lavender tube (EDTA)

Specimen Preparation:
Test must be scheduled with Vanderbilt Medical Esoteric Coagulation Laboratory 615-875-5631.

Pediatric Collection:
Four 2.7 mL light blue tubes (3.2% Sodium Citrate) and one Lavender tube (EDTA)

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Monday - Friday by appointment.

Stability:
Ambient (15-25°C): 4 hours

Specimen:
Citrated platelet poor plasma.

Alternate Specimen:

RNA Polymerase III Antibody, IgG

LAB3823

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- RNA pol 3
- RNA Pol III IgG
- RNA Polymerase III Ab
- LAB3823-VML
- LAB3823VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun, Tue, Thu

ORDERING

Synonyms:

- RNA pol 3
- RNA Pol III IgG
- RNA Polymerase III Ab
- LAB3823-VML
- LAB3823VML

Ordering Recommendations:
First-line test for the evaluation of systemic sclerosis, or connective tissue disease with renal or cutaneous involvement. Preferred test is Comprehensive Systemic Sclerosis Panel (3000480).

Performed:
Sun, Tue, Thu

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
RNA Polymerase III Antibody, IgG	19 Units or less

Interpretive Data:

The presence of RNA polymerase III IgG antibody, when considered in conjunction with other laboratory and clinical findings, is an aid in the diagnosis of systemic sclerosis (SSc) with increased incidence of skin involvement and renal crisis with the diffuse cutaneous form of SSc. RNA polymerase III IgG antibody occur in about 11-23 percent of SSc patients, and typically in the absence of anti-centromere and anti-Scl-70 antibodies.
A negative result indicates no detectable IgG antibodies to the dominant antigen of RNA polymerase III and does not rule out the possibility of SSc. False-positive results may also occur due to non-specific binding of immune complexes. Strong clinical correlation is recommended.

If clinical suspicion remains, consider additional testing for other antibodies associated with SSc, including centromere, Scl-70, U3-RNP, PM/Scl, or Th/To.

Component	Interpretation
RNA Polymerase III Antibody, IgG	19 Units or less Negative 20-39 Units Weak Positive 40-80 Units Moderate Positive 81 Units or greater Strong Positive

RNP IgG, serum or plasma

LAB3466

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB3466, Anti-RNP
- LAB3466-VML
- LAB3466VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used in conjuction with the ANA assay to evaluate patients with signs and symptoms of systemic lupus erythematosus and other connective tissue diseases

Synonyms:

- LAB3466, Anti-RNP
- LAB3466-VML
- LAB3466VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
Anti-RNP

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Positive result of RNP antibodies is indicative of mixed connective tissue disease (MCTD) and other systemic autoimmune rheumatic diseases, such as systemic lupus erythematosus (SLE), systemic sclerosis, and myositis. Antibodies targeting the RNP antigenic complex also recognize Smith antigens, therefore, the Smith antibody response must be considered when interpreting these results.

Rubella Antibodies, IgG and IgM

LAB865

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Rubella Antibodies, IgG and IgM
- rubella panel
- Rubella serology
- Rubella Ab, IgG IgM
- LAB865-VML
- LAB865VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Plasma or urine. Contaminated, heat-inactivated, or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Rubella Antibodies, IgG and IgM
- rubella panel
- Rubella serology
- Rubella Ab, IgG IgM
- LAB865-VML
- LAB865VML

Ordering Recommendations:
Aid in the diagnosis of suspected rubella infection.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Rubella Antibody IgM	19.9 AU/mL or less

Interpretive Data:

Testing immediately post-exposure is of no value without a later convalescent specimen. While the presence of IgM antibodies suggests current or recent infection, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection or immunization.

The best evidence for current infection is a significant change on two appropriately timed specimens, where both tests are done in the same laboratory at the same time.

The magnitude of the measured result is not indicative of the amount of antibody present.

Component	Reference Interval
Rubella Antibody, IgG	Less than 9 IU/mL: Not Detected. 9-9.9 IU/mL: Indeterminate - Repeat testing in 10-14 days may be helpful. 10 IU/mL or greater: Detected.
Rubella Antibody, IgM	19.9 AU/mL or less: Not Detected. 20.0 - 24.9 AU/mL: Indeterminate - Repeat testing in 10-14 days may be helpful. 25.0 AU/mL or greater: Detected - IgM antibody to rubella detected, which may indicate a current or recent infection or immunization.

Methodology:

Semi-Quantitative Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

CPT Codes:

86762 x2

Section:

RF-ARUP

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Allow specimen to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:

Plasma or urine. Contaminated, heat-inactivated, or hemolyzed specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- Rubella Antibodies, IgG and IgM
- rubella panel
- Rubella serology
- Rubella Ab, IgG IgM
- LAB865-VML
- LAB865VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

Within 24 hours

Ordering Recommendations:

Aid in the diagnosis of suspected rubella infection.

Interpretive Data:

Testing immediately post-exposure is of no value without a later convalescent specimen. While the presence of IgM antibodies suggests current or recent infection, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection or immunization.

The best evidence for current infection is a significant change on two appropriately timed specimens, where both tests are done in the same laboratory at the same time.

The magnitude of the measured result is not indicative of the amount of antibody present.

Component	Reference Interval
Rubella Antibody, IgG	Less than 9 IU/mL: Not Detected. 9-9.9 IU/mL: Indeterminate - Repeat testing in 10-14 days may be helpful. 10 IU/mL or greater: Detected.
Rubella Antibody, IgM	19.9 AU/mL or less: Not Detected. 20.0 - 24.9 AU/mL: Indeterminate - Repeat testing in 10-14 days may be helpful. 25.0 AU/mL or greater: Detected - IgM antibody to rubella detected, which may indicate a current or recent infection or immunization.

Rubella IgG, serum

LAB496

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB496, RUB
- LAB496-VML
- LAB496VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is intended to be used as an aid in the determination of serological status to rubella virus or rubella vaccination.

Synonyms:

- LAB496, RUB
- LAB496-VML
- LAB496VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Chemiluminescent Immunoassay

Components:
Rubella IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A negative result indicates that the patient has not been infected/immunized to rubella virus. A positive result indicates past exposure to rubella or previous vaccination.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Rufinamide, Serum or Plasma

LAB3824

ORDERING INFO

Collect:
Plain Red. Also acceptable: Lavender (K_2 or K_3EDTA), or Pink (K_2EDTA).

Synonyms:

- banzel blood level
- rufinamide blood level
- Banzel
- LAB3824-VML
- LAB3824VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain Red. Also acceptable: Lavender (K_2 or K_3EDTA), or Pink (K_2EDTA).

Specimen Preparation:
Separate from cells ASAP or within 2 hours. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 2 weeks

Performed:
Mon-Fri

ORDERING

Synonyms:

- banzel blood level
- rufinamide blood level
- Banzel
- LAB3824-VML
- LAB3824VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Mon-Fri

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:

Therapeutic Range	5-30 µg/mL
Dose-related range (values at dosages of 800-7200 mg/day)	3-30 µg/mL
Toxic	Not well established

Interpretive Data:
Adverse effects may include somnolence, vomiting, headache and fatigue.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

All Targets: Not Detected

Interpretive Data:
cobas® SARS-CoV-2 & Influenza A/B assay for use on the cobas® 6800/8800 Systems (cobas® SARS-CoV-2 & Influenza A/B) is an automated multiplex real-time RT-PCR assay intended for simultaneous qualitative detection and differentiation of SARS-CoV-2, influenza A virus, and/or influenza B virus RNA in healthcare provider-collected nasal and nasopharyngeal swab specimens, and self-collected nasal swab specimens (collected in a healthcare setting with instruction by a healthcare provider) from individuals suspected of respiratory viral infection consistent with COVID-19 by their healthcare provider. cobas® SARS-CoV-2 & Influenza A/B is intended for use as an aid in the differential diagnosis of SARS-CoV-2 , influenza A, and influenza B in humans and is not intended to detect influenza C.

Schistosoma Antibody IgG by ELISA

LAB6369

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plain Red.

Synonyms:

- Schistosomiasis
- LAB6369-VML
- LAB6369VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, grossly hemolyzed, or lipemic specimens.

Storage/Transport Temperature:
Preferred transport temp: Refrigerated. Also acceptable: Frozen

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Tue, Sat

ORDERING

Synonyms:

- Schistosomiasis
- LAB6369-VML
- LAB6369VML

Ordering Recommendations:
May aid in the diagnosis of schistosomiasis caused by infection with S. mansoni, especially in travelers to endemic areas.

Performed:
Tue, Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-6 days

Notes:
N/A

RESULTS INTERPRETATION

Reference Interval:

< 9 U	Negative - No significant level of Schistosoma IgG antibody detected.
9 - 11 U	Equivocal - Recommend repeat testing in 2-4 weeks with fresh sample.
>11 U	Positive - IgG antibodies to Schistosoma detected, which may suggest current or past infection.

Interpretive Data:
Refer to report.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

ADDITIONAL INFORMATION

CPT Codes:
86682

Scl-70 IgG, serum or plasma

LAB771

ORDERING INFO

Collect:

Red tube (no gel)

Synonyms:

- LAB771, SCA, Anti-Scl
- LAB771-VML
- LAB771VML

Turn Around Time:

1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:

NA

Collect:

Red tube (no gel)

Specimen Preparation:

Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:

Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:

Refrigerated (2-8°C)

Performed:

Daily

Stability:

Refrigerated (2-8°C): 7 days

Specimen:

Serum or plasma

Alternate Specimen:

Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:

This test is used in conjuction with the ANA assay to evaluate patients with signs and symptoms of systemic scleroderma and other connective tissue diseases

Synonyms:

- LAB771, SCA, Anti-Scl
- LAB771-VML
- LAB771VML

Performed:

Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
Scl-70 IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive test result for Scl 70 antibodies is consistent with a diagnosis of scleroderma.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Sedimentation Rate, Erythrocyte Sedimentation Rate

LAB322

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- Sedimentation Rate, ESR, Erythrocyte Sedimentation Rate, SED
- LAB322-VML
- LAB322VML

Turn Around Time:

2 hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Collect to fill line on tube, gently invert back and forth immediately for blood to mix with EDTA anitcoagulant to prevent clotting. Do not draw above IV line. (Min 2.0mL)

Pediatric Collection:

Pediatric: 0.5mL EDTA 2K whole blood minimum

Storage/Transport Temperature:

Room temperature or refrigerated

Performed:

Daily

Stability:

Room temperature samples must be run within 8 hours of collection. Samples refrigerated at 2-8°C are acceptable from VPLS areas within 24 hours, but must be brought to room temperature for 15 minutes before testing.

Specimen:

Whole Blood

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Non-Specific screening test for infection, inflammation, degenerative diseases or neoplasm

Selenium, Serum or Plasma

LAB579

ORDERING INFO

Collect:
Royal blue (No Additive), Royal blue (K2EDTA), or Royal blue (NaHep).

Synonyms:

- Se
- Serum selenium level
- SES
- LAB579-VML
- LAB579VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician).

Collect:
Royal blue (No Additive), Royal blue (K2EDTA), or Royal blue (NaHep).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum or plasma to an ARUP Trace Element-Free Transport Tube (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens that are not separated from the red cells or clot within 2 hours. Specimens collected in containers other than specified. Specimens transported in containers other than specified.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated or frozen.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Indefinitely

Performed:
Sun-Sat

ORDERING

Synonyms:

- Se
- Serum selenium level
- SES
- LAB579-VML
- LAB579VML

Ordering Recommendations:
May be useful in the assessment of recent intake. For the assessment of deficiency or toxicity, Selenium, Urine (0025067) is preferred.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
23.0-190.0 µg/L

Interpretive Data:

Elevated results may be due to contamination from skin or other collection-related issues, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of serum/plasma selenium, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Serum selenium levels can be used in the determination of deficiency or toxicity. Plasma and serum contains 75 percent of the selenium measured in whole blood and reflects recent dietary intake. Selenium deficiency can occur endemically or as a result of sustained TPN or restricted diets and has been associated with cardiomyopathy and may exacerbate hypothyroidism. Selenium toxicity is relatively rare. Excess intake of selenium can result in symptoms consistent with selenosis and include gastrointestinal upset, hair loss, white blotchy nails, and mild nerve damage.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Serotonin Release Assay

LAB3448

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB3448, SRA, Serotonin Release Assay for HIT
- LAB3448-VML
- LAB3448VML

Turn Around Time:

1 -5 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Once or twice per week, variable days

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

Serum Separator Tube(SST).

Specimen Preparation:
Separate from cells within 1 hour of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Specimens other than serum. Non-frozen specimens.

Storage/Transport Temperature:
Frozen. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 24 hours; Frozen: 1 month

Performed:
Mon, Wed, Thu, Fri, Sat

ORDERING

Synonyms:

- 5-Hydroxy Tryptamine
- 5-Hydroxytryptamine
- 5-HT
- LAB121-VML
- LAB121VML

Ordering Recommendations:
Preferred serotonin test when diagnosing carcinoid tumors is Serotonin, Whole Blood (0080395).

Performed:
Mon, Wed, Thu, Fri, Sat

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
1-5 days

Notes:
Medications that may affect serotonin concentrations include lithium, MAO inhibitors, methyldopa, morphine, and reserpine. In general, foods that contain serotonin do not interfere significantly. Slight increases may be seen in acute intestinal obstruction, acute MI, cystic fibrosis, dumping syndromes, and nontropical sprue. Metastasizing abdominal carcinoid tumors often show serotonin concentrations greater than 400 ng/mL.

In general, EDTA whole blood (as compared to serum) preserved with ascorbic acid will give values most representative of blood concentrations. Most (95 percent) of blood serotonin is found in platelets. Refer to Serotonin, Whole Blood (ARUP test code 0080395).

RESULTS INTERPRETATION

Reference Interval:
50-220 ng/mL

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

ADDITIONAL INFORMATION

CPT Codes:
84260

Serum Amyloid A (mc1) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath202

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- SAA

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Serum Protein Electrophoresis/Immunofixation

LAB119

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB119, SI, SPE, SPEP, Protein Electrophoresis
- LAB119-VML
- LAB119VML

Turn Around Time:
5 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Red tube (no gel)

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1.5 mL serum to standard labeled secondary tube. (Min: >1.0mL Blood)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Refrigerated: (2-8°C)

Performed:
Monday - Friday

Stability:
Refrigerated: (2-8°C): 72 hours

Specimen:
Blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Test order includes a total protein. Assay includes identification of monoclonal gammopathies in serum (SPEP and Immunofixation included).

Synonyms:

- LAB119, SI, SPE, SPEP, Protein Electrophoresis
- LAB119-VML
- LAB119VML

Performed:
Monday - Friday

Turn Around Time:
5 days

Methodology:
Protein Gel Electrophoresis

Components:
Includes both electrophoresis densitometric scan and immunofixation of Kappa and Lambda.

RESULTS INTERPRETATION

Reference Interval:
No monoclonal detected

Interpretive Data:
Serum protein electrophoresis is primarily useful for the detection of gammopathies, including those associated with lymphoproliferative neoplasms. Immunofixation, included in the testing, can identify the heavy and light chain involved in monoclonal bands that may be detected. In assessment of a new patient, correlation with urine protein electrophoresis may be indicated.

Methodology:
Protein Gel Electrophoresis

Sex Hormone Binding Globulin

LAB3825

ORDERING INFO

Collect:
Serum separator tube. Also acceptable: Green (lithium heparin).

Synonyms:

- TeBG
- Testosterone-Estradiol Binding Globulin
- Sex Steroid Binding Protein
- Testosterone-Estradiol Binding Globulin (TeBG)
- SHBG
- Testosterone-Estrogen Binding Globulin
- SBP
- LAB3825-VML
- LAB3825VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Also acceptable: Green (lithium heparin).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Unacceptable Conditions:
Specimens collected in lavender (EDTA) or pink (K_2EDTA). Grossly hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 1 week; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Sickledex Screening for Sickling Hemoglobin

LAB339

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- SKD, Sickle Cell screen
- LAB339-VML
- LAB339VML

Turn Around Time:
Stat 1 hour; Routines batched Monday-Friday Daily

SPECIMEN REQUIREMENTS

Patient Preparation:
False positives or false negatives may occur in patients with a recent blood transfusion.

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Collect to fill line on tube, gently invert back and forth immediately for blood to mix with EDTA anitcoagulant to prevent clotting. Do not draw above IV line. (Min 1.0mL)

Pediatric Collection:
Pediatric: 0.25mL EDTA 2K whole blood minimum

Storage/Transport Temperature:
Refrigerated

Performed:
Monday - Friday, STAT's 24/7

Stability:
Whole Blood samples stored at 2°C to 8°C for up to 3 weeks may be used for testing.

Specimen:
Whole Blood

ORDERING

Ordering Indicators:
Not recommended for infants under six months of age due to elevated levels of Hemoglobin F

Synonyms:

- SKD, Sickle Cell screen
- LAB339-VML
- LAB339VML

Performed:
Monday - Friday, STAT's 24/7

Turn Around Time:
Stat 1 hour; Routines batched Monday-Friday Daily

Methodology:
Reduced Hemoglobin S is insoluble in the concentrated phosphate buffer and forms a cloudy, turbid suspension

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
All positive test results should be further evaluated by hemoglobin electrophoresis.

Methodology:
Reduced Hemoglobin S is insoluble in the concentrated phosphate buffer and forms a cloudy, turbid suspension

ADDITIONAL INFORMATION

Section:
Hematology

Additional Information:
False positives or false negatives may occur in patients with severe anemia (<=15% hematocrit).

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Smith IgG, serum or plasma

LAB2001

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB2001, Smith ENA, SEA, ENA
- LAB2001-VML
- LAB2001VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used in conjuction with the ANA assay to evaluate patients with signs and symptoms of a connective tissue disease in whom the test for antinuclear antibodies is positive

Synonyms:

- LAB2001, Smith ENA, SEA, ENA
- LAB2001-VML
- LAB2001VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
Smith IgG

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result for Smith antibodies is consistent with a diagnosis of lupus erythematosus.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Synonyms:

- LAB2001, Smith ENA, SEA, ENA
- LAB2001-VML
- LAB2001VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 Day

Ordering Indicators:
This test is used in conjuction with the ANA assay to evaluate patients with signs and symptoms of a connective tissue disease in whom the test for antinuclear antibodies is positive

Interpretive Data:
A positive result for Smith antibodies is consistent with a diagnosis of lupus erythematosus.

Reference Interval:
Negative

Additional Information:
NA

Methodology:
Multiplex Flow Immunoassay

Section:
Immunoserology

Smith/RNP (ENA) Antibody, IgG

LAB772

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Ribonucleoproteins
- RNP
- LAB772-VML
- LAB772VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Plasma or other body fluids. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Ribonucleoproteins
- RNP
- LAB772-VML
- LAB772VML

Ordering Recommendations:
Useful in the differential diagnosis of connective tissue diseases with or without myopathy.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme Immunoassay (EIA)

Reported:
1-3 days

Notes:
An affinity purified RNP/Sm antigen complex is used in this assay.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Smith/RNP (ENA) Ab, IgG	19 Units or less

Interpretive Data:

Smith/RNP antibodies are frequently seen in patients with mixed connective tissue disease (MCTD) and are also associated with other systemic autoimmune rheumatic diseases (SARDs), such as systemic lupus erythematosus (SLE), systemic sclerosis, and myositis. Antibodies targeting the Smith/RNP antigenic complex also recognize Smith antigens, therefore, the Smith antibody response must be considered when interpreting these results.

Component	Interpretation
RNP (U1) (Ribonucleic Protein) (ENA) Antibody, IgG	19 Units or less Negative 20-39 Units Weak Positive 40-80 Units Moderate Positive 81 Units or greater Strong Positive

Methodology:

Semi-Quantitative Enzyme Immunoassay (EIA)

SNaPshot AML Panel, Whole blood, bone marrow

LAB5781

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB5781, AMS, AML SNaPshot
- LAB5781-VML
- LAB5781VML

Turn Around Time:

7 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:

Monday, Thursday

Stability:

EDTA and ACD-A: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C

Specimen:

Blood, bone marrow, purified DNA

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

Analysis of 37 common mutations in 3 genes (IDH1/IDH2/FLT3) to assist in diagnosis and determine treatment of acute myeloid leukemia (AML)

Synonyms:

- LAB5781, AMS, AML SNaPshot
- LAB5781-VML
- LAB5781VML

Performed:

Monday, Thursday

Turn Around Time:

7 days

Methodology:
Multiplex PCR/multiplex base extension using the SNaPshot methodology; Laboratory Developed Test

Components:
Panel includes varients in exon 4 of genes IDH1 and IDH2, and the tyrosine kinase domain of the fms-related tyrosine kinase 3 (FLT3-TKD).

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This assay will detect the presence of tested variants with a sensitivity of roughly 2-10%.

Methodology:
Multiplex PCR/multiplex base extension using the SNaPshot methodology; Laboratory Developed Test

ADDITIONAL INFORMATION

Section:
Molecular Diagnostics

Alternate Specimen:
Yellow tube (ACD-A)

Sodium, Plasma or Serum

LAB122

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- NA, Sodium Blood, Sodium Level, LAB122
- LAB122-VML
- LAB122VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.2 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Room Temperature: 15° to 25°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 2 weeks; 2° to 8°C: 2 weeks; Frozen: 1 year

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

Soluble Liver Antigen Antibody, IgG

LAB3827

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Anti-SLA-LP
- Anti-SLA/LP
- LAB3827-VML
- LAB3827VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun, Tue, Thu

ORDERING

Synonyms:

- Anti-SLA-LP
- Anti-SLA/LP
- LAB3827-VML
- LAB3827VML

Ordering Recommendations:
Recommended for the evaluation of autoimmune liver disease or hepatitis of unknown etiology.

Performed:
Sun, Tue, Thu

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Soluble Liver Antigen Antibody, IgG	24.9 U or less

Interpretive Data:
The presence of SLA antibodies has almost 100% specificity for autoimmune hepatitis, although only 12-30% have these antibodies. Thus, a negative SLA IgG test does not rule out autoimmune hepatitis.

Component	Interpretation
Soluble Liver Antigen Antibody, IgG	20.0 Units or less Negative 20.1-24.9 Equivocal 25.0 Units or greater Positive

Somatostatin Quantitative, Plasma

LAB1095

ORDERING INFO

Collect:
Lavender (K_2 or K_3 EDTA). Collect in a prechilled tube.

Synonyms:

- LAB1095-VML
- LAB1095VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (K_2 or K_3 EDTA). Collect in a prechilled tube.

Specimen Preparation:
Separate plasma from cells ASAP. Transfer 1.8 mL plasma to an ARUP Standard Transport Tube and freeze immediately. (Min: 0.6 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Thawed specimens. Grossly icteric or lipemic specimens.

Storage/Transport Temperature:
CRITICAL FROZEN.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 8 hours; Frozen: 28 days

Specific Extractable Nuclear Antigen (ENA) Antibody Panel, serum or plasma

LAB3457

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB3457, ENA, ENA Panel
- LAB3457-VML
- LAB3457VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or Plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used in conjuction with the ANA assay to evaluate patients with signs and symptoms of systemic lupus erythematosus and other connective tissue diseases

Synonyms:

- LAB3457, ENA, ENA Panel
- LAB3457-VML
- LAB3457VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
SSA, SSB, Scl-70, Smith, Sm/RNP

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Positive results for these antibodies are suggestive of connective tissue diseases such as Systemic Lupus Erythematosus, Sjogren's Syndrome, Scleroderma, and Polymyositis.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:

SPUTUM CYTOLOGY

ORDERING INFO

Collect:
Clean specimen container

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container

Specimen Preparation:
1. Collect specimen in a clean specimen container (min 1 mL). 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: Obtain as much as clinical judgement allows)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Fresh specimen in a clean specimen container.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc. Special stains for fungus (GMS stain) or AFB can be ordered if applicable.

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation, tumor, or infectious process.

Methodology:
ThinPrep procedure

SSA 52 and 60 (Ro) (ENA) Antibodies, IgG

LAB3830

ORDERING INFO

Collect:
Serum separator tube (SST).

Synonyms:

- Anti-Ro
- Ro
- Ro Autoantibodies
- Sjogren's Antibody
- Sjogren Syndrome
- SSA Autoantibodies
- Anti-SSA; Anti-SSA (Ro) (ENA) Antibody
- Anti-SSA
- Anti-SSA (Ro) (ENA) Antibody
- LAB3830-VML
- LAB3830VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Plasma or other body fluids. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Anti-Ro
- Ro
- Ro Autoantibodies
- Sjogren's Antibody
- Sjogren Syndrome
- SSA Autoantibodies
- Anti-SSA; Anti-SSA (Ro) (ENA) Antibody
- Anti-SSA
- Anti-SSA (Ro) (ENA) Antibody
- LAB3830-VML
- LAB3830VML

Ordering Recommendations:
May be useful as a secondary screen based on results of ANA test or if ANA IFA is negative and Sj&oumlgren syndrome, systemic lupus erythematosus (SLE), systemic sclerosis, or myositis is strongly suspected.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Multiplex Bead Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
SSA-52 (Ro52) (ENA) Antibody, IgG	40 AU/mL or less
SSA-60 (Ro60) (ENA) Antibody, IgG	40 AU/mL or less

Interpretive Data:

SSA-52 (Ro52) and/or SSA-60 (Ro60) antibodies are associated with a diagnosis of Sjögren syndrome, systemic lupus erythematosus (SLE), and systemic sclerosis. SSA-52 antibody overlaps significantly with the major SSc-related antibodies. SSA-52 (Ro52) antibody occurs frequently in patients with inflammatory myopathies, often in the presence of interstitial lung disease.

Component	Interpretation
SSA-52 (Ro52) (ENA) Antibody, IgG	29 AU/mL or Less: Negative 30-40 AU/mL: Equivocal 41 AU/mL or greater: Positive
SSA-60 (Ro60) (ENA) Antibody, IgG	29 AU/mL or Less: Negative 30-40 AU/mL: Equivocal 41 AU/mL or greater: Positive

Methodology:

Semi-Quantitative Multiplex Bead Assay

1 swab

Alternate Specimen:
N/A

Patient Preparation:
N/A

Specimen:
Nares swab

Reasons for Rejection:
Specimen received on cotton or calcium alginate swabs, leaking container, dry swabs. Frozen unacceptable.

Components:
Culture and identification

Stability:
Ambient: (15-25°C) 48 hours Refrigerated: (2-8°C) 48 hours

Storage/Transport Temperature:
Ambient: (15-25°C) (Refrigerated: (2-8°C)

Synonyms:

- MRSA culture
- MSSA culture, SA Culture
- C SA
- LAB234-VML
- LAB234VML

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1-2 days. Positives are reported as soon as detected.

Ordering Indicators:
Evaluation of colonization by Staphylococcus aureus (MSSA or MRSA)

Interpretive Data:
N/A

Reference Interval:
Negative

Additional Information:
Includes culture and identification. Susceptibility testing not routinely performed, other than methicillin resistance.

Methodology:
Aerobic bacterial culture

Section:
Microbiology

STAT-6 (EP325) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

Sterile container

LAB3145

ORDERING INFO

Collect:
Prefer collection tube kit for CSF labeled with numbers one through 4

Synonyms:

- HSF, Hematology spinal fluid
- LAB3145-VML
- LAB3145VML

Turn Around Time:
48 hours (excluding weekends and holidays) for routine cases. Cases with concomitant flow cytometry may require a longer turn-around time

SPECIMEN REQUIREMENTS

Patient Preparation:
Lab must be informed if the patient had prior or has suspected Leukemia or Lymphoma. For patients with a history of or suspected carcinoma (or malignancy other than Heme), it is recommended that CSF Cytology (Test code CYC) be ordered and sent to Cytopathology

Collect:
Prefer collection tube kit for CSF labeled with numbers one through 4

Specimen Preparation:
(Min. 0.4 ml spinal fluid)

Pediatric Collection:
400 microliters of specimen

Storage/Transport Temperature:
Recommend walking CSF specimens directly to Specimen Processing

Performed:
Monday-Friday

Stability:
Room temperature for 2 hours, refrigerate if longer

Specimen:
CSF: Fresh specimen; deliver to the lab immediately

Alternate Specimen:
Sterile Container

ORDERING

Streptolysin O Antibody (ASO)

LAB6066

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Streptococcal antibodies
- Anti-Streptolysin O Antibody
- ASO antibody test
- LAB6066-VML
- LAB6066VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL)

Unacceptable Conditions:
Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 8 days; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Streptococcal antibodies
- Anti-Streptolysin O Antibody
- ASO antibody test
- LAB6066-VML
- LAB6066VML

Ordering Recommendations:
Confirm a prior infection with group A Streptococcus in patients suspected of having a nonsuppurative complication such as acute glomerulonephritis (AGN) or acute rheumatic fever (ARF). DNase-B Antibody (0050220) and Streptolysin O Antibody (ASO) (0050095) antibody tests are generally ordered concurrently.

Performed:
Sun-Sat

Methodology:
Quantitative Nephelometry

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
0-1 year: Less than 200 IU/mL
2-12 years: Less than 240 IU/mL
13 years and older: Less than 330 IU/mL

Interpretive Data:
Elevated titers of antideoxyribonuclease B antibody (anti-DNase B) or antistreptolysin O antibody (ASO) indicate a recent group A Streptococcus infection. Anti-DNase B antibodies typically remain elevated longer than ASO and may remain elevated for several months after infection. Patients suspected of having complications related to a recent Streptococcus infection such as acute glomerulonephritis or acute rheumatic fever may have elevated anti-DNase B but normal ASO antibody titers. A negative or very low anti-DNase B and ASO antibody titers, especially from a specimen tested 2 weeks after a suspected infection, indicates unlikely incidence of a recent Streptococcus infection.

Methodology:
Quantitative Nephelometry

Sulfate-3-Glucuronyl Paragloboside (SGPG) Antibody, IgM

LAB3832

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- SGPG IgM
- SGPG Ab
- SGPG Antibody
- LAB3832-VML
- LAB3832VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL)

Unacceptable Conditions:
Plasma or urine. Contaminated, heat-inactivated, hemolyzed, icteric, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Tue

ORDERING

Synonyms:

- SGPG IgM
- SGPG Ab
- SGPG Antibody
- LAB3832-VML
- LAB3832VML

Ordering Recommendations:
Non-panel testing for autoimmune neuropathies. Test by itself is not diagnostic and should be used in conjunction with other clinical parameters to confirm disease.

Performed:
Tue

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:
Less than 1.00 IV

Interpretive Data:
The majority of SGPG IgM positive sera will show reactivity against MAG. Patients that are SGPG IgM positive and MAG IgM negative may have multi-focal motor neuropathy with conduction block.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Sweat Chloride Analysis, Macroduct sweat collection system

LAB1726

ORDERING INFO

Collect:

2 Macroduct sweat collection system (one for left wrist and one for right)

Synonyms:

- LAB1726, SWT
- LAB1726-VML
- LAB1726VML

Turn Around Time:

1 hour

SPECIMEN REQUIREMENTS

Patient Preparation:

Powder free gloves are to be worn when performing sweat chloride collection and testing. Patient should avoid use of lotions or creams prior to sample collection. The patient's skin should be properly cleaned prior to collecting the sweat.

Collect:

2 Macroduct sweat collection system (one for left wrist and one for right)

Specimen Preparation:

Schedule collection with Respiratory Care, 615-936-2994 (Minimum 15 microliters sweat)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Sample should be sent to lab through pneumatic tube system. Sample will be received by specimen receiving and delivered to bench to be tested.

Performed:

Monday - Friday

Stability:

Ambient (15-25°C): 6 hours

Specimen:

Sweat

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

This test would be ordered to confirm a suspected cystic fibrosis (CF) diagnosis. The presence of CF is usually suggested by family history of an affected sibling, physical exmaination, and X-ray findings.

Synonyms:

- LAB1726, SWT
- LAB1726-VML

Normal: < 30 mmol/L; Intermediate: 30-59 mmol/L; Abnormal: >/= 60 mmol/L Source: 2019 CLSI guidelines

Interpretive Data:
Any salts containing chloride or other halides (halogens) such as fluoride, bormide, or iodide will interfere and cause an elevated reading. Halides including chloride may be present in lotions or creams, so it is important that the patient's skin is properly cleaned prior to collecting the sweat. Improperly cleaned skin prior to sweat collection can lead to false positive results. There is no relationship between the value of the sweat chloride and the severity of the disease, although patients diagnosed later in life tend to have lower sweat values, possibly reflecting less severer phenotypes.

Methodology:
Digital Chloridometer

ADDITIONAL INFORMATION

Section:
Special Chemistry

Alternate Specimen:
N/A

Additional Information:
Testing is only performed during 1st shift.

Components:
Sweat Volume, R Sweat Volume, L Chloride Sweat, R Chloride Sweat, L

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
2 Macroduct sweat collection system (one for left wrist and one for right)

Specimen Preparation:
Schedule collection with Respiratory Care, 615-936-2994 (Minimum 15 microliters sweat)

Pediatric Collection:
N/A

Preferred Collection Volume:
25 microliters sweat

Alternate Specimen:
N/A

Patient Preparation:
Powder free gloves are to be worn when performing sweat chloride collection and testing. Patient should avoid use of lotions or creams prior to sample collection. The patient's skin should be properly cleaned prior to collecting the sweat.

Specimen:
Sweat

Reasons for Rejection:
QNS

Components:
Sweat Volume, R Sweat Volume, L Chloride Sweat, R Chloride Sweat, L

Stability:
Ambient (15-25°C): 6 hours

Storage/Transport Temperature:
Sample should be sent to lab through pneumatic tube system. Sample will be received by specimen receiving and delivered to bench to be tested.

Synonyms:

- LAB1726, SWT
- LAB1726-VML
- LAB1726VML

Performed:
Monday - Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 hour

Ordering Indicators:
This test would be ordered to confirm a suspected cystic fibrosis (CF) diagnosis. The presence of CF is usually suggested by family history of an affected sibling, physical exmaination, and X-ray findings.

Interpretive Data:
Any salts containing chloride or other halides (halogens) such as fluoride, bormide, or iodide will interfere and cause an elevated reading. Halides including chloride may be present in lotions or creams, so it is important that the patient's skin is properly cleaned prior to collecting the sweat. Improperly cleaned skin prior to sweat collection can lead to false positive results. There is no relationship between the value of the sweat chloride and the severity of the disease, although patients diagnosed later in life tend to have lower sweat values, possibly reflecting less severer phenotypes.

T -Cell Gene Rearrangement, Whole blood, bone marrow, tissue

LAB3042

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB3042, T-Cell Clonality, T gamma, TCR, gamma gene rearrangement
- LAB3042-VML
- LAB3042VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Paraffin embedded tissue block or Cytology specimen (preferred). Required tumor burden 15%, please include surgical pathology report. Curls and unstained slides should be cut 10 micron thick with two accompanying H&E stained slides cut before and after unstained slides or curls. Tissue blocks will be returned after testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

Two Lavender microtainers (EDTA), bone marrow, or paraffin embedded tissue

Storage/Transport Temperature:

EDTA and ACD-A tubes: Ambient (15-25°C) or Refrigerated (2-8°C); paraffin block: Ambient (15-25°C); purified DNA: Refrigerated (2-8°C) or Frozen (-20°C); CSF: Refrigerated (2-8°C)

Performed:

Tuesday or Wednesday

Stability:

EDTA and ACD-A tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Paraffin block: indefinitely; Purified DNA: indefinitely at -70°C; CSF - call Molecular Diagnostics Lab at 615-343-8121

Specimen:

Whole blood, bone marrow, paraffin embedded tissue, purified DNA, CSF

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

Used to determine whether T-cell clonality is present to aid in the diagnosis and monitoring of T-cell lymphoproliferative disorders.

Synonyms:

- LAB3042, T-Cell Clonality, T gamma, TCR, gamma gene rearrangement
- LAB3042-VML
- LAB3042VML

Performed:
Tuesday or Wednesday

Turn Around Time:
10 days

Methodology:
Fluorescent PCR using primers specific for regions Vgamma 2 - Vgamma11, Jgamma1, and Jgamma2 with fragment size analysis by capillary electrophoresis. Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
No detection of clonal population

Interpretive Data:
Provides a semi-quantitative assessment of T-cell clonality. Clinical correlation is required.

Methodology:
Fluorescent PCR using primers specific for regions Vgamma 2 - Vgamma11, Jgamma1, and Jgamma2 with fragment size analysis by capillary electrophoresis. Laboratory Developed Test

T Uptake

LAB6506

ORDERING INFO

Collect:
Serum Separator Tube (SST). Also acceptable: Lavender (K2EDTA or K3EDTA), pink (K2EDTA), or green (lithium heparin).

Synonyms:

- T3 Uptake
- T4 uptake, S
- T4U, serum
- TBC
- THBR
- Thyroid binding ratio
- Triiodothyronine uptake, serum
- Thyroxine-binding capacity
- Thyroxine-binding index
- LAB6506-VML
- LAB6506VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST). Also acceptable: Lavender (K2EDTA or K3EDTA), pink (K2EDTA), or green (lithium heparin).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Grossly hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation of cells: Ambient: 8 days; Refrigerated: 2 weeks; Frozen: 2 years

Performed:
Sun-Sat

ORDERING

Synonyms:

- T3 Uptake
- T4 uptake, S
- T4U, serum
- TBC
- THBR
- Thyroid binding ratio
- Triiodothyronine uptake, serum
- Thyroxine-binding capacity
- Thyroxine-binding index
- LAB6506-VML
- LAB6506VML

Ordering Recommendations:
Not recommended for routine thyroid disorder screening; for initial screening, refer to Thyroid Stimulating Hormone (0070145).The preferred alternative to this test is Thyroxine, Free (Free T4) (0070138).

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay (ECLIA)

Reported:
Within 24 hours

Notes:
T uptake is of little clinical value alone; it is used to determine the free thyroxine index.

RESULTS INTERPRETATION

Reference Interval:
0.8-1.3 TBI

Interpretive Data:
Thyroxine, Free (Free T4) (0070138) is the preferred test alternative for T Uptake and Free Thyroxine Index tests.

Methodology:
Quantitative Electrochemiluminescent Immunoassay (ECLIA)

ADDITIONAL INFORMATION

CPT Codes:

Tapentadol, Urine, Quantitative

LAB3241

ORDERING INFO

Collect:
Random urine.

Synonyms:

- urine tapentadol concentration
- Nucynta
- Tapentadol, Quantitative, Urine
- LAB3241-VML
- LAB3241VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 2 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 1 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years.

Performed:
Mon

ORDERING

Synonyms:

- urine tapentadol concentration
- Nucynta
- Tapentadol, Quantitative, Urine
- LAB3241-VML
- LAB3241VML

Ordering Recommendations:
Preferred test to follow-up presumptive results. For general screening, Tapentadol Urine Screen with Reflex to Quantitation (2012294) is preferred.

Performed:
Mon

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Drugs Covered	Cutoff Concentrations
Tapentadol	50 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry
Positive Cutoff:
Tapentadol: 50 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Testosterone (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy)

LAB3839

ORDERING INFO

Collect:
Serum separator tube or green (sodium or lithium heparin).

Synonyms:

- Total Testosterone
- LAB3839-VML
- LAB3839VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect between 6-10 a.m.

Collect:
Serum separator tube or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.2 mL)

Unacceptable Conditions:
EDTA plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Total Testosterone
- LAB3839-VML
- LAB3839VML

Ordering Recommendations:
Use this mass spectrometry test to measure a wide range of testosterone concentrations. Most useful when low concentrations are expected, regardless of the patient's sex assigned at birth. Use to monitor testosterone-suppressing hormone therapies (eg, antiandrogens or estrogens). Free or bioavailable testosterone measurements may provide supportive information.To compare this test to other testosterone tests, refer to the ARUP Testosterone Tests Comparison table.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Effective August 19, 2013

Synonyms:

- TeBG
- Testosterone-estrogen Binding Globulin
- LAB839-VML
- LAB839VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect specimen between 6-10 a.m.

Collect:
Serum separator tube or green (lithium heparin).

Specimen Preparation:
Transfer 2 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.6 mL)

Unacceptable Conditions:
EDTA plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 1 week; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- TeBG
- Testosterone-estrogen Binding Globulin
- LAB839-VML
- LAB839VML

Ordering Recommendations:
Provides a calculated value for bioavailable testosterone concentration using total testosterone measured by immunoassay. Use to evaluate hypogonadism in cisgender males with a total testosterone concentration at the lower limit of normal. May be used to evaluate testosterone status in individuals with protein-binding abnormalities or to monitor testosterone hormone therapies. Not recommended when low testosterone concentrations, such as those found in children and cisgender females, are expected. For these individuals, testing by mass spectrometry is recommended; refer to Testosterone, Bioavailable and Total, Includes Sex Hormone-Binding Globulin (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy) (0081057).To compare this test to other testosterone tests, refer to the ARUP Testosterone Tests Comparison table.

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay/Calculation

Reported:
Within 24 hours

Notes:
Bioavailable testosterone includes free plus weakly bound (non-SHBG bound) testosterone. Bioavailable testosterone is an assessment of the biologically active testosterone in serum.

The concentrations of free and bioavailable testosterone are derived from mathematical expressions based on constants for the binding of testosterone to albumin and/or sex hormone binding globulin.

RESULTS INTERPRETATION

Reference Interval:

Components

Reference Interval

Testosterone, Free Calculation

Age	Male (pg/mL)
14-15 years	3-138

Tanner Stage III	13-104	12-98
Tanner Stage IV	11-60	14-151
Tanner Stage V	11-71	23-165

Interpretive Data:

Bioavailable testosterone concentration is calculated using total testosterone (measured by immunoassay) and the binding constant of testosterone and sex hormone-binding globulin (SHBG) and/or albumin. Testosterone immunoassays are both imprecise and inaccurate at low testosterone concentrations, such as those found in children and cisgender females. For these individuals, testing by mass spectrometry is recommended; refer to Testosterone, Bioavailable and Total, Includes Sex Hormone-Binding Globulin (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy) (ARUP test code 0081057).

For individuals on testosterone hormone therapy, refer to cisgender male reference intervals. No reference intervals have been established for males younger than 14 years or for cisgender females. For a complete set of all established reference intervals, refer to ltd.aruplab.com/Tests/Pub/0070102.

Bioavailable testosterone concentration is calculated using total testosterone (measured by immunoassay) and the binding constant of testosterone and sex hormone-binding globulin (SHBG) and/or albumin. Testosterone immunoassays are both imprecise and inaccurate at low testosterone concentrations, such as those found in children and cisgender females. For these individuals, testing by mass spectrometry is recommended; refer to Testosterone, Bioavailable and Total, Includes Sex Hormone-Binding Globulin (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy) (ARUP test code 0081057).

For individuals on testosterone hormone therapy, refer to cisgender male reference intervals. No reference intervals have been established for males younger than 14 years or for cisgender females. For a complete set of all established reference intervals, refer to ltd.aruplab.com/Tests/Pub/0070102.

Tanner Stage IV	11-60	14-151
Tanner Stage V	11-71	23-165

Methodology:
Quantitative Electrochemiluminescent Immunoassay/Calculation

Section:
RF-ARUP

CPT Codes:
84402; 84403; 84270

Notes:

Bioavailable testosterone includes free plus weakly bound (non-SHBG bound) testosterone. Bioavailable testosterone is an assessment of the biologically active testosterone in serum.

The concentrations of free and bioavailable testosterone are derived from mathematical expressions based on constants for the binding of testosterone to albumin and/or sex hormone binding globulin.

Testosterone, Free (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy)

LAB3836

ORDERING INFO

Collect:
Serum separator tube or green (sodium or lithium heparin).

Synonyms:

- LAB3836-VML
- LAB3836VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect between 6-10 a.m.

Collect:
Serum separator tube or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.8 mL)

Unacceptable Conditions:
EDTA plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- LAB3836-VML
- LAB3836VML

Ordering Recommendations:
Provides a calculated value for free testosterone concentration using total testosterone measured by mass spectrometry. May be used to evaluate hyperandrogenism in children and cisgender females, monitor testosterone-suppressing hormone therapies (eg, antiandrogens or estrogens), evaluate testosterone status in individuals with protein-binding abnormalities, or evaluate hypogonadism in cisgender males.To compare this test to other testosterone tests, refer to the ARUP Testosterone Tests Comparison table.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry/Electrochemiluminescent Immunoassay/Calculation

Reported:
1-5 days

Notes:
Total testosterone and SHBG are measured and free testosterone is estimated from these measurements.

RESULTS INTERPRETATION

Tetanus Antibody, IgG

LAB855

ORDERING INFO

Collect:
Serum separator tube. "Post" specimen should be drawn 30 days after immunization.

Synonyms:

- Tetanus Immune Response
- Tetanus toxoid antibodies
- Tetanus Vaccine Response
- Anti-tetanus toxoid IgG
- C. tetani
- Clostridium tetani
- LAB855-VML
- LAB855VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. "Post" specimen should be drawn 30 days after immunization.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL) "Pre" and "post" vaccine specimens can be submitted separately or together for testing; if shipped separately, "post" specimen must be received within 60 days of "pre" specimen. Mark specimens clearly as "Pre-Vaccine" or "Post-Vaccine".

Unacceptable Conditions:
Plasma or other body fluids. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

- Tetanus Immune Response
- Tetanus toxoid antibodies
- Tetanus Vaccine Response
- Anti-tetanus toxoid IgG
- C. tetani
- Clostridium tetani
- LAB855-VML
- LAB855VML

Ordering Recommendations:
Evaluate the ability of a patient to produce antibody to pure protein vaccine after vaccination to rule out antibody deficiency.

Performed:
Sun-Sat

Methodology:
Quantitative Multiplex Bead Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
Antibody concentration of > 0.1 IU/mL is usually considered protective.

Interpretive Data:

Responder status is determined according to the ratio of a one-month post-vaccination specimen to pre-vaccination concentration of tetanus IgG antibodies as follows:

1. If the post-vaccination concentration is less than 1.0 IU, the patient is considered a nonresponder.
2. If the post-vaccination concentration is greater than or equal to 1.0 IU, a patient with a ratio of less than 1.5 is a nonresponder, a ratio of 1.5 to less than 3.0, a weak responder, and a ratio of 3.0 or greater, a good responder.
3. If the pre-vaccination concentration is greater than 1.0, it may be difficult to assess the response based on a ratio alone. A post-vaccination concentration above 2.5 IU in this case is usually adequate.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

THC Metabolite, Urine, Quantitative

LAB6105

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Dronabinol
- Marinol
- THC
- Marijuana
- Pain Management
- 9-Carboxy-THC
- Cannabinoids
- Cannabis
- LAB6105-VML
- LAB6105VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 1 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 1 Month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Dronabinol
- Marinol
- THC
- Marijuana
- Pain Management
- 9-Carboxy-THC
- Cannabinoids
- Cannabis
- LAB6105-VML
- LAB6105VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is THC (Cannabinoids), Urine Screen with Reflex to Quantitation (2012270). This test does not distinguish between the delta-8 and delta-9 forms of THC or their metabolites.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Compare to Pain Management, Marijuana Metabolite, Quantitative, with medMATCH, Urine; Pain Management, Marijuana Metabolite, with Confirmation with medMATCH, Urine.

RESULTS INTERPRETATION

Reference Interval:

Effective November 18, 2019

Drugs Covered	Cutoff Concentrations
11-Nor-9-carboxy-THC	15 ng/mL

Interpretive Data:

Methodology: Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff: 15 ng/mL

For medical purposes only; not valid for forensic use.

The drug analyte detected in this assay, 9-carboxy THC, is a metabolite of delta-9-tetrahydrocannabinol (THC). Detection of 9-carboxy THC suggests use of, or exposure to, a product containing THC. This test cannot distinguish between prescribed or non-prescribed forms of THC, nor can it distinguish between active or passive use. The 9-carboxy THC metabolite can be detected in urine for several weeks. Normalization of results to creatinine concentration can help document elimination or suggest recent use, when specimens are collected at least one week apart.

Thiopurine Methyltransferase, RBC

LAB3840

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Synonyms:

- TPMT
- TPMT-RBC
- 6 mercaptopurine
- TPMT Enzyme
- TPMT Erythrocytes
- LAB3840-VML
- LAB3840VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Transport 5 mL whole blood. (Min: 3 mL)

Unacceptable Conditions:
Gel separator tubes. Specimens collected in sodium fluoride/potassium oxalate (gray). Hemolyzed, frozen, or room temperature specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 3 hours; Refrigerated: 6 days; Frozen: Unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- TPMT
- TPMT-RBC
- 6 mercaptopurine
- TPMT Enzyme
- TPMT Erythrocytes
- LAB3840-VML
- LAB3840VML

Ordering Recommendations:
Use this phenotyping test to assess risk for severe myelosuppression with standard dosing of thiopurine drugs in individuals for whom thiopurine therapy is being considered. This test must be performed prior to the initiation of thiopurine therapy. For thiopurine dosing optimization, refer to Thiopurine Metabolites in Red Blood Cells (3016503). For pharmacogenetic testing (prior to or during treatment), refer to TPMT and NUDT15 (3001535).

Performed:
Sun-Sat

Methodology:
Enzymatic Assay/Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
3-5 days

Notes:
This assay measures only enzyme activity.

RESULTS INTERPRETATION

Reference Interval:

Normal TPMT activity: 24.0-44.0 U/mL - Individuals are predicted to be at low risk of bone marrow toxicity (myelosuppression) as a consequence of standard thiopurine therapy; no dose adjustment is recommended.

Intermediate TPMT activity: 17.0-23.9 U/mL - Individuals are predicted to be at intermediate risk of bone marrow toxicity (myelosuppression), as a consequence of standard thiopurine therapy; a dose reduction and therapeutic drug management is recommended.

Low TPMT activity: < 17.0 U/mL - Individuals are predicted to be at high risk of bone marrow toxicity (myelosuppression) as a consequence of standard thiopurine dosing. It is recommended to avoid the use of thiopurine drugs.

High TPMT activity: > 44.0 U/mL - Individuals are not predicted to be at risk for bone marrow toxicity (myelosuppression) as a consequence of standard thiopurine dosing, but may be at risk for therapeutic failure due to excessive inactivation of thiopurine drugs. Individuals may require higher than the normal standard dose. Therapeutic drug management is recommended.

Interpretive Data:

The TPMT, RBC assay is used as a screen to detect individuals with low and intermediate TPMT activity who may be at risk for myelosuppression when exposed to standard doses of thiopurines, including azathioprine (Imuran) and 6-mercaptopurine (Purinethol). TPMT is the primary metabolic route for inactivation of thiopurine drugs in the bone marrow. When TPMT activity is low, it is predicted that proportionately more 6-mercaptopurine can be converted into the cytotoxic 6-thioguanine nucleotides that accumulate in the bone marrow causing excessive toxicity. The activity of TPMT is measured by the nanomoles of 6-methylmercaptopurine (inactive metabolite) produced per 1 mL of packed red blood cells, (U/mL).

TPMT phenotype testing does not replace the need for clinical monitoring of patients treated with thiopurine drugs. Genotype for TPMT cannot be inferred from TPMT activity (phenotype). Phenotype testing should not be requested for patients currently treated with thiopurine drugs. Current TPMT phenotype may not reflect future TPMT phenotype, particularly in patients who received blood transfusion within 30-60 days of testing. TPMT enzyme activity can be inhibited by several drugs such as: naproxen (Aleve), ibuprofen (Advil, Motrin), ketoprofen (Orudis), furosemide (Lasix), sulfasalazine (Azulfidine), mesalamine (Asacol), olsalazine (Dipentum), mefenamic acid (Ponstel), thiazide diuretics, and benzoic acid inhibitors. TPMT inhibitors may contribute to falsely low results; patients should abstain from these drugs for at least 48 hours prior to TPMT testing. Falsely low results may also occur as a result of inappropriate specimen handling and hemolysis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

LAB324

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB324, TT
- LAB324-VML
- LAB324VML

Turn Around Time:

2 hours once received into lab

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Thyroglobulin and Anti-Thyroid Antibodies, serum

LAB533

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB533, THG
- LAB533-VML
- LAB533VML

Turn Around Time:
3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Red tube (no gel)

Specimen Preparation:
Specimens should be centrifuged immediately and the separated serum frozen. (Minimum: 0.7 mL serum)

Pediatric Collection:
Red microtainer (no gel)

Storage/Transport Temperature:
Frozen (-20°C)

Performed:
Monday - Friday

Stability:
After separation from cells: Ambient (15-25°C): no longer than 8 hours Refrigerated (2-8°C): 2 days Frozen (-20°C): 2 months

Specimen:
Serum

Alternate Specimen:
Light green tube (Lithium heparin with gel)

ORDERING

Ordering Indicators:
This test is used in the diagnosis and monitoring of Hashimoto's disease, Graves' disease, thyroid adenoma, subacute thyroiditis, and thyroid carcinoma. Thyroglobulin is also measured to complement radioiodine scanning and other techniques (such as ultrasound or immunohistochemical staining) to determine the presence or absence of functioning thyroid tissue, or an increase in such tissue relative to an individually established baseline.

Synonyms:

- LAB533, THG
- LAB533-VML
- LAB533VML

Performed:
Monday - Friday

Turn Around Time:
3 days

Methodology:
Chemiluminescent Immunoassay

Components:
Thyroglobulin and Thyroglobulin Antibody

RESULTS INTERPRETATION

Reference Interval:
Thyroglobulin Reference Intervals: 6 months - 4 years: 7.4 - 48.7 ng/mL 4 - 8 years: 4.1 - 40.5 ng/mL 8 - 18 years: 0.8 - 29.4 ng/mL 18 years and older: 1.3 - 31.8 ng/mL Thyroglobuin Antibody Reference Interval: 0 - 4 IU/mL

Interpretive Data:
Samples containing thyroglobulin antibodies cannot be reliably measured for thyroglobulin. Results should be interpreted in light of the total clinical presentation of the patient, including: symptoms, clinical history, data from additional tests, and other appropriate information.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Special Chemistry

Alternate Specimen:
Light green tube (Lithium heparin with gel)

Additional Information:
This test includes the measurement of thyroglobulin and anti-thyroglobulin antibodies. This assay demonstrates interference with biotin. Samples should not be taken from patients receiving therapy with biotin doses until at least 8 hours following the last biotin administration.

Components:
Thyroglobulin and Thyroglobulin Antibody

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Red tube (no gel)

Thyroglobulin by LC-MS/MS, Serum or Plasma

LAB3841

ORDERING INFO

Collect:
Serum separator tube or green (sodium or lithium heparin), potassium EDTA

Synonyms:

- LAB3841-VML
- LAB3841VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or green (sodium or lithium heparin), potassium EDTA

Specimen Preparation:
Separate from cells: Transport 1.5 mL serum or plasma. (Min: 0.7 mL)

Unacceptable Conditions:
Samples left ambient for greater than 1 day; grossly lipemic samples.

Storage/Transport Temperature:
Refrigerated or frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 day; Refrigerated: 1 week; Frozen: 1 year

Performed:
Mon, Wed, Thu, Sat

ORDERING

Synonyms:

- LAB3841-VML
- LAB3841VML

Ordering Recommendations:
Recommended test for quantifying thyroglobulin in individuals with antithyroglobulin antibodies. Aids in surveillance of residual/recurrent thyroid cancer in individuals who have developed antibodies to thyroglobulin.

Performed:
Mon, Wed, Thu, Sat

Methodology:
High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-6 days

RESULTS INTERPRETATION

Reference Interval:

Age	Reference Interval
6 months - 3 years	7.4 - 48.7 ng/mL
4 - 7 years	4.1 - 40.5 ng/mL
8 - 17 years	0.8 - 29.4 ng/mL
18 years and older	1.3 - 31.8 ng/mL

Interpretive Data:
Lower limit of detection for thyroglobulin by LC-MS/MS is 0.5 ng/mL.

Methodology:
High Performance Liquid Chromatography-Tandem Mass Spectrometry

Thyroid Stimulating Hormone Receptor Antibody (TRAb)

LAB3842

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Anti-TSHR
- Antibodies to TSH receptor
- Inhibitory Immunoglobulin
- TBII
- TBII (Thyrotropin-Binding Inhibitory Immunoglobulin)
- Thyroid-Stimulating Hormone Receptor (TSH Receptor) Antibody
- Thyrotropin Receptor Antibody
- TRAb
- TSH Receptor Antibody
- TSH Receptor Blocking Antibody
- Anti-Thyrotropin
- LAB3842-VML
- LAB3842VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Allow serum separator to sit for 15-20 minutes at room temperature for proper clot formation. Centrifuge and separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Plasma. Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Preferred transport temp: Frozen. Also acceptable: Refrigerated.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 6 days; Frozen: 12 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Anti-TSHR
- Antibodies to TSH receptor
- Inhibitory Immunoglobulin
- TBII
- TBII (Thyrotropin-Binding Inhibitory Immunoglobulin)
- Thyroid-Stimulating Hormone Receptor (TSH Receptor) Antibody
- Thyrotropin Receptor Antibody
- TRAb
- TSH Receptor Antibody
- TSH Receptor Blocking Antibody
- Anti-Thyrotropin
- LAB3842-VML
- LAB3842VML

Ordering Recommendations:
Acceptable secondary test for autoimmune thyroid disease.

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay (ECLIA)

Reported:
1-2 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 1.75 IU/L

Thyroid Stimulating Immunoglobulin

LAB6111

ORDERING INFO

Collect:
Serum Separator Tube (SST), Green (Lithium Heparin), or Lavender (K EDTA).

Synonyms:

- Autoimmune Thyroid Stimulator
- Thyroid Stimulating Antibody
- Thyroid-Stimulating Immunoglobulin Serum
- TSI
- TSI concentration
- LAB6111-VML
- LAB6111VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST), Green (Lithium Heparin), or Lavender (K EDTA).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Autoimmune Thyroid Stimulator
- Thyroid Stimulating Antibody
- Thyroid-Stimulating Immunoglobulin Serum
- TSI
- TSI concentration
- LAB6111-VML
- LAB6111VML

Ordering Recommendations:
Acceptable test secondary for autoimmune thyroid disease.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

0.54 IU/L or less	Consistent with healthy thyroid function or non-Graves thyroid or autoimmune disease. Those with healthy thyroid function typically have results less than 0.1 IU/L.
0.55 IU/L or greater	Consistent with Graves disease (autoimmune hyperthyroidism).

Interpretive Data:
This assay specifically detects thyroid stimulating autoantibodies. For diagnostic purposes, the results obtained from this assay should be used in combination with clinical examination, patient medical history, and other findings.

Methodology:
Semi-Quantitative Chemiluminescent Immunoassay

Thyroxine, Free by Equilibrium Dialysis/HPLC-Tandem Mass Spectrometry

LAB3744

ORDERING INFO

Collect:
Plain red or serum separator tube (SST).

Synonyms:

- Direct Dialysis
- FT4
- T4, Free, Equilibrium Dialysis
- LAB3744-VML
- LAB3744VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube (SST).

Specimen Preparation:
Separate from cells or gel ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 4 days; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Sun, Tue, Thu

ORDERING

Synonyms:

- Direct Dialysis
- FT4
- T4, Free, Equilibrium Dialysis
- LAB3744-VML
- LAB3744VML

Ordering Recommendations:
Not recommended for routine evaluation of thyroid disorders; preferred test is Thyroxine, Free (Free T4) (0070138). Useful to evaluate free thyroxine (FT4) status in individuals with protein-binding abnormalities. Some medications may induce transient changes in FT4 concentrations. This test is not recommended for patients currently receiving heparin treatment because FT4 concentrations may be falsely elevated.

Performed:
Sun, Tue, Thu

Methodology:
Quantitative Equilibrium Dialysis (ED)/Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-6 days

RESULTS INTERPRETATION

Reference Interval:

Effective May 16, 2011

Free Thyroxine ng/dL		
Age	**Female**	**Male**
25-30 weeks gestation	0.5-3.3 ng/dL	0.5-3.3 ng/dL

Tiagabine Quantitative, Serum/Plasma

LAB5998

ORDERING INFO

Collect:
Plain Red, Lavender (EDTA), or Pink (K_2EDTA).

Synonyms:

- Gabitril
- LAB5998-VML
- LAB5998VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Pre-dose (trough) draw.

Collect:
Plain Red, Lavender (EDTA), or Pink (K_2EDTA).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.4 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Separator tubes.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 1 month; Refrigerated: 1 month; Frozen: 48 months

Performed:
Varies

Gross Description and Diagnosis

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Submit in 10% Neutral Buffered Formalin

Specimen Preparation:
Tissue should be placed in fixative as soon as possible after collection. Complete Test Requisition and include pertinent clinical data and billing information. Seal specimen containers completely and submit in a specimen bag. Submit completed requisition in pocket of specimen bag.

Pediatric Collection:
N/A

Preferred Collection Volume:
Tissue should be entirely covered in 10% neutral buffered formalin.

Alternate Specimen:
N/A

Patient Preparation:
N/A

Specimen:
Biopsy tissue for routine pathology examination

Reasons for Rejection:
Incorrect or incomplete patient identification. Label both the test requisition and specimen container with 2 patient identifiers.

Components:
Gross Description and Diagnosis

Stability:
Fixed tissue-Ambient: (15-25°C) indefinitely

Storage/Transport Temperature:
Ambient: (15-25°C)

Synonyms:

- Tissue Biopsy, Pathology Tissue, Punch Biopsy, Core Biopsy

Performed:
Monday-Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
4 days

Ordering Indicators:
N/A

Interpretive Data:
N/A

Reference Interval:
N/A

Additional Information:
Formalin is hazardous and should be handled with care as to not leak. Breast biopsies must fix in 10% neutral buffered formalin for a minimum of 6 hours and a maximum of 72 hours for ancillary predictive marker testing. Shorter or longer fixation may impact results.

Methodology:

Histological preparation and microscopic interpretation. Ancillary stains or procedures may be required at the request of the pathologist.

Section:

Surgical Pathology

Tissue Transglutaminase IgA and IgG with reflex EMA, serum or plasma

LAB721

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB721, TTE
- LAB721-VML
- LAB721VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 1.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C):7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA)

ORDERING

Ordering Indicators:
Evaluating patients suspected of having celiac disease, including patients with compatible symptoms, patients with atypical symptoms, and individuals at increased risk (family history, previous diagnosis with associated disease).

Synonyms:

- LAB721, TTE
- LAB721-VML
- LAB721VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
tTG IgA, tTG IgM

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The recommended screening test for celiac disease is tissue transglutaminase IgA (tTG IgA) . Tissue transglutaminase IgG (tTG IgG) and deamidated gliadin IgG should only be used for diagnosis when a patient has a total IgA deficiency. The IgG-based tests have a lower specificity and therefore a lower positive predictive value. If the patient has a positive serology and celiac disease is likely, consider consulting the VUMC adult celiac gastroenterology clinic or pediatric gastroenterology clinic to discuss diagnosis further. Patients should continue to consume gluten until seen in the clinic.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA)

Additional Information:
If the quantitative IgA is >5 and the tTG IgA is positive, automatic reflex to ARUP test EMA IgA; If the quantitative IgA is <5 and the tTG IgG is positive, automatic reflex to ARUP test EMA IgG.

Components:
tTG IgA, tTG IgM

Resulting Laboratory:
Vanderbilt Medical Laboratories

Tobramycin Peak, Plasma or Serum

LAB36

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- TPK, TML, Nebcin, Tobrex, LAB36
- LAB36-VML
- LAB36VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Dark Green Microtainer (Sodium Heparin)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 2° to 8°C: 7 days; Frozen: 14 days

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:

Toll-Like Receptor Function

LAB3845

ORDERING INFO

Collect:
Green (sodium heparin) (patient) AND green (sodium heparin) (control). Also acceptable: Yellow (ACD solution A) (patient) AND yellow (ACD solution A) (control). Patient and control specimens must be collected within 48 hours of test performance.

Synonyms:

- TLR Function
- LAB3845-VML
- LAB3845VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect control specimen from a healthy individual unrelated to patient at approximately the same time as and under similar conditions to the patient.

Collect:
Green (sodium heparin) (patient) AND green (sodium heparin) (control). Also acceptable: Yellow (ACD solution A) (patient) AND yellow (ACD solution A) (control). Patient and control specimens must be collected within 48 hours of test performance.

Specimen Preparation:
Transport 10 mL whole blood (patient) AND 10 mL whole blood (control) in original collection tubes. (Min: 7 mL (patient) AND 7 mL (control)) Do not refrigerate or freeze. LIVE CELLS REQUIRED.

Infant Minimum: 3 mL whole blood (patient) AND 7 mL whole blood (control).

For patients who are lymphopenic, collection of 10 mL of whole blood, rather than the minimum required volumes, is recommended to increase the likelihood that a sufficient number of lymphocytes can be isolated for testing.

Unacceptable Conditions:
Yellow (ACD solution B). Refrigerated or frozen specimens.

Storage/Transport Temperature:
CRITICAL ROOM TEMPERATURE.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: Unacceptable; Frozen: Unacceptable
New York State Clients: Ambient 24 hours; Refrigerated: Unacceptable; Frozen: Unacceptable

Performed:
Sun, Tue, Wed, Thu, Fri, Sat

ORDERING

Synonyms:

- TLR Function
- LAB3845-VML
- LAB3845VML

Ordering Recommendations:
Aids in diagnosis of innate immunodeficiencies when genetic defects of the innate immune system are suspected in individuals negative for other immunodeficiencies (eg, no detectable abnormality of antibody function, complement activity, neutrophil function, or cell-mediated immunity). This test does not measure the function of toll-like receptor 3 (TLR3). Molecular testing is the preferred method for detection of defects in TLR3. For patients who are lymphopenic, collection of 10 mL of whole blood, rather than the minimum required volumes, is recommended to increase the likelihood that a sufficient number of lymphocytes can be isolated for testing.

Performed:
Sun, Tue, Wed, Thu, Fri, Sat

Methodology:
Cell Culture/Quantitative Multiplex Bead Assay

Reported:
9-10 days

Notes:

Results for TNF alpha, IL-1 beta, and IL-6 are reported as pg/mL. Interpretation comparing the patient results to the simultaneously collected client normal control and the laboratory normal control will be provided by an ARUP medical director.

Limitation: Defects in IRAK-4 and MyD88 result in compromised TLR signaling. Exception is endosomal TLR4, which is IRAK-4 and MyD88 independent.

RESULTS INTERPRETATION

Reference Interval:

By report

Interpretive Data:

Toll-like receptors (TLR) are tested independently by stimulation with TLR-specific ligands in a peripheral blood mononuclear cell (PBMC) culture. PBMC production of IL-1 beta, IL-6, and TNF alpha is determined by multiplex bead assay for TLR 1,2,4-8.

TLR-specific ligands include Pam3CSK4, a synthetic bacterial lipoprotein (TLR2-TLR1 ligand); zymosan cell wall particles from Saccharomyces cerevisiae (TLR6-TLR2 ligand); lipopolysaccharide (LPS) ultra-pure S. minnesota LPS (TLR4 ligand); flagellin purified from S. typhimurium (TLR5 ligand); and CL097 imidazoquinoline compound (TLR7-TLR8 ligand).

TORCH Antibodies, IgM

LAB3846

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- Cytomegalic Inclusion Disease (CMID)
- Cytomegalovirus (CMV)
- Herpes Simplex Virus (HSV)
- TORCH
- TORCH IgM
- TORCH Profile IgM
- Toxoplasma gondii (T. gondii)
- Toxoplasmosis
- LAB3846-VML
- LAB3846VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

Remarks:
Mark specimens plainly as "acute" or "convalescent."

ORDERING

Synonyms:

- Cytomegalic Inclusion Disease (CMID)
- Cytomegalovirus (CMV)
- Herpes Simplex Virus (HSV)
- TORCH
- TORCH IgM
- TORCH Profile IgM
- Toxoplasma gondii (T. gondii)
- Toxoplasmosis
- LAB3846-VML
- LAB3846VML

Ordering Recommendations:
Not recommended for diagnosing congenital infections in newborns; tests should be selected individually to target the most likely infectious agents.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Chemiluminescent Immunoassay /Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-2 days

Notes:
This test should not be used for blood donor screening, associated re-entry protocols, or for screening Human Cell, Tissues, and Cellular- and tissue-based products (HCT/P).

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Rubella Antibody IgM	19.9 AU/mL or less
CMV Antibody IgM	29.9 AU/mL or less
Toxoplasma gondii Ab, IgM	7.9 AU/mL or less
HSV 1 and/or 2 Abs, IgM by ELISA	0.89 IV or less

Interpretive Data:

Component	Interpretation
Cytomegalovirus Antibody, IgM	29.9 AU/mL or less: Not Detected. 30.0-34.9 AU/mL: Indeterminate - Repeat testing in 10-14 days may be helpful. 35.0 AU/mL or greater: Detected - IgM antibody to CMV detected, which may indicate a current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.
Herpes Simplex Virus Type 1 and/or 2 Antibodies, IgM by ELISA	0.89 IV or less: Not Detected. 0.90-1.09 IV: Indeterminate. Repeat testing in 10-14 days may be helpful. 1.10 IV or greater: Detected. IgM antibody to HSV detected, which may indicate a current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post infection.
Rubella Antibody, IgM	19.9 AU/mL or less: Not Detected. 20.0 - 24.9 AU/mL: Indeterminate - Repeat testing in 10-14 days may be helpful. 25.0 AU/mL or greater: Detected - IgM antibody to rubella detected, which may indicate a current or recent infection or immunization.
Toxoplasma gondii Antibody, IgM	7.9 AU/mL or less: Not Detected. 8.0-9.9 AU/mL: Indeterminate - Repeat testing in 10-14 days may be helpful. 10.0 AU/mL or greater: Detected - Significant level of Toxoplasma gondii IgM antibody detected and may indicate a current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

Methodology:
Semi-Quantitative Chemiluminescent Immunoassay /Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Total Cholesterol, Plasma or Serum

LAB60

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- CHL, Cholesterol Blood, LAB60
- LAB60-VML
- LAB60VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.3 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 7 days; 2° to 8°C: 7 days; Frozen: 3 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:
N/A

Synonyms:

- CHL, Cholesterol Blood, LAB60
- LAB60-VML
- LAB60VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Enzymatic Assay

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
>18 years: <200 mg/dL

Interpretive Data:
A desirable serum cholesterol concentration in adults is less than 200 mg/dL and less than 170 mg/dL in children. A borderline-high serum cholesterol concentration in adults is 200-239 mg/dL and 170-199 mg/dL in children. A high serum cholesterol concentration in adults is greater than 239 mg/dL and greater than 199 mg/dL in children.

Methodology:
Enzymatic Assay

Toxoplasma gondii IgG and IgM, serum or plasma

LAB501

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB501, TOX
- LAB501-VML
- LAB501VML

Turn Around Time:
1 Day

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum or plasma)

Pediatric Collection:
Two Red Microtainers (no gel), or Two Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum or plasma

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used to detect past or recent infection with Toxoplasma gondii.

Synonyms:

- LAB501, TOX
- LAB501-VML
- LAB501VML

Performed:
Daily

Turn Around Time:
1 Day

Methodology:
Multiplex Flow Immunoassay

Components:
Toxoplasma IgG Toxoplasma IgM

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Positve IgG and negative IgM suggest previous infection. Positive IgG and positive IgM suggest recent infection.

Methodology:
Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel) Lavender tube (EDTA) Light green tube (Lithium heparin with gel) Dark green tube (Sodium heparin)

Additional Information:
To confirm positive IgM results, specimen will be sent to Palo Alto Reference Lab.

Components:
Toxoplasma IgG Toxoplasma IgM

Resulting Laboratory:
Vanderbilt Medical Laboratories

Tramadol and Metabolite, Urine, Quantitative

LAB448

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Ultracet
- Ultram
- urine tramadol concentration
- urine ultram concentration
- O-Desmethyltramadol
- Ryzolt
- Tramadol, Quantitative, Urine
- Tramal
- LAB448-VML
- LAB448VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 2 mL urine with no additives or preservatives an ARUP Standard Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Performed:
Sun-Sat

ORDERING

Synonyms:

- Ultracet
- Ultram
- urine tramadol concentration
- urine ultram concentration
- O-Desmethyltramadol
- Ryzolt
- Tramadol, Quantitative, Urine
- Tramal
- LAB448-VML
- LAB448VML

Ordering Recommendations:
Preferred test to follow-up presumptive results. For general screening, Tramadol, Urine Screen with Reflex to Quantitation (2012297) is preferred.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:

Effective May 2018

Drugs Covered	Cutoff Concentrations
Tramadol	25 ng/mL
O-desmethyltramadol	25 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry
Positive cutoff:
Tramadol: 25 ng/mL
O-desmethyltramadol: 25 ng/mL

For medical purposes only; not valid for forensic use.

The presence of metabolite(s) without parent drug is common and may indicate use of parent drug during the prior week.

The absence of expected drug(s) and/or drug metabolite(s) may indicate non-compliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Trazodone, Serum/Plasma

LAB6451

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K2 or K_3EDTA) or pink (K_2EDTA).

Synonyms:

- Desyrel
- desyrel blood level
- Molipaxin
- trazodone blood level
- LAB6451-VML
- LAB6451VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K2 or K_3EDTA) or pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 2 weeks; Frozen: 4 months

Performed:
Wed

ORDERING

Synonyms:

- Desyrel
- desyrel blood level
- Molipaxin
- trazodone blood level
- LAB6451-VML
- LAB6451VML

Ordering Recommendations:
Use to optimize drug therapy and monitor patient adherence.

Performed:
Wed

Methodology:
Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval	
Trazodone_Serum/Plasma	Therapeutic Range:	800-1600 ng/mL
	Toxic:	Not well established

Interpretive Data:

Trazodone is a selective serotonin reuptake inhibitor antidepressant drug indicated for the treatment of major depressive disorder. The pharmacokinetics of trazodone is influenced by drug-drug interactions that induce or inhibit CYP3A4 metabolism. Adverse effects may include sedation, fatigue, headache, blurred vision, nausea, and cardiac arrhythmia. The risk of serotonin syndrome is increased with concomitant use of other serotonergic drugs. Concomitant use of trazodone with anticoagulants and nonsteroidal anti-inflammatory drugs may increase the risk of bleeding.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Methodology:

Liquid Chromatography-Tandem Mass Spectrometry

ADDITIONAL INFORMATION

CPT Codes:

80338 (Alt code: G0480)

Section:

RF-ARUP

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Plain red. Also acceptable: Lavender (K2 or K_3EDTA) or pink (K_2EDTA).

Specimen Preparation:

Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Patient Preparation:

Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Unacceptable Conditions:

Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Stability (from collection to initiation):

After separation from cells: Ambient: 24 hours; Refrigerated: 2 weeks; Frozen: 4 months

Storage/Transport Temperature:

Refrigerated.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Vaginal Swab: Aptima Multitest Swab)

Specimen Preparation:

Swab: Place swab in Swab Specimen Transport Tube, break shaft off at scoreline then recap tube. Urine: Transfer 2 mL urine within 24 hours to Aptima Urine Specimen Transport Tube. Liquid level must be between fill lines on tube. ThinPrep: Collect Endocervical bursh and place in ThinPrep container. (Min 1.0mL Urine), (Min 1.0mL ThinPrep)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Aptima Swab: 30 days; Thin Prep vial: 30 days; Urine: 24 hours at Ambient (15-25°C), 30 days in Aptima Kit

Specimen:

ThinPrep, Vaginal/Cervical Swabs, Urine

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:

Trichomonas vaginalis Infections in women cause vaginitis, urethritis, and cervicitis. Discharge and small hemorrhagic lesions may be present in the genitourinary tract. Complications can include premature labor, low-birth-weight offspring, premature rupture of membranes, and post-abortion or posthysterectomy infection. An association with pelvic inflammatory disease, tubal infertility, and cervical cancer with previous episodes of trichomoniasis has been reported. Symptomatic women with trichomoniasis usually complain of vaginal discharge, vulvovaginal soreness, and/or irritation. Dysuria is also common. However, it has been estimated that 10 to 50% of T. vaginalis infections in women are asymptomatic, and in men the proportion may even be higher

Synonyms:

- LAB5930, MIDL PCR Trich, Trichomonas, Wet Prep, Vaginitis
- LAB5930-VML
- LAB5930VML

Performed:

Monday - Friday

Turn Around Time:

72 hours

Methodology:

Transcription-Mediated Amplification (TMA)

Components:

None

RESULTS INTERPRETATION

Reference Interval:

Not Detected

Interpretive Data:

A negative result does not completely rule out infection with T. vaginalis. Results should be interpreted in conjunction with other clinical data. This test has not been validated for use with self-collected vaginal swab specimens from patients. This test is intended for medical purposes only and is not valid for the evaluation of suspected sexual abuse or for other forensic purposes.

Methodology:

Transcription-Mediated Amplification (TMA)

ADDITIONAL INFORMATION

Section:

Molecular Infectious Disease

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

Additional Information:

Please note the following special collection instructions for each specimen. Cervix: Aptima Unisex Swab (White Tube), ThinPrep: Cervical brush in ThinPrep (Preservcyt), Vaginal: Aptima Multitest Swab (Orange Tube), Urine: Urine Clear vacutainer, Urethral: Aptima Unisex Swab (White Tube). Aptima collection kits are not acceptible for CT/NG testing, which requires a different collection kit. Please refer to the "CT/NG PCR" order for more details.

Serum separator tube or plasma separator tube. Also acceptable: Lavender (K_3EDTA or K_2EDTA) or pink (K_2EDTA), Green (lithium heparin)

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Grossly hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 5 days; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- 3, Free, Serum
- Free T3
- Free T3 Only, S
- Free Triiodothyronine
- FT3
- T3, Free
- LAB137-VML
- LAB137VML

Ordering Recommendations:
Not recommended for routine thyroid screening; for initial thyroid disorder screening, refer to Thyroid Stimulating Hormone (0070145).

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Effective February 22, 2022

0-3 days	2.0-7.9 pg/mL
4-30 days	2.0-5.2 pg/mL
1-24 months	1.6-6.4 pg/mL
2-6 years	2.0-6.0 pg/mL
7-11 years	2.7-5.2 pg/mL
12-19 years	2.3-5.0 pg/mL
20 years and older	2.5-4.3 pg/mL

Tropheryma whipplei PCR

LAB3850

ORDERING INFO

Collect:
Lavender (EDTA), Pink (K_2EDTA), or Serum Separator Tube (SST). Also acceptable: CSF or tissue.

Synonyms:

- LAB3850-VML
- LAB3850VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), Pink (K_2EDTA), or Serum Separator Tube (SST). Also acceptable: CSF or tissue.

Specimen Preparation:
Transfer 1 mL serum, plasma, whole blood, or CSF to a sterile container. (Min: 0.5 mL)
Tissue: Transfer to a sterile container and freeze immediately. Also acceptable: Formalin-fixed paraffin-embedded (FFPE) tissue.

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
FFPE: Room temperature.
All Others: Frozen.

Stability (from collection to initiation):
Tissue: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 month
FFPE: Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable
All Others: Ambient: 24 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Tue, Fri

Troponin T (cTnT) 5th Generation

LAB6028

ORDERING INFO

Collect:
Plasma Separator Tube (PST), or Green (Lithium Heparin).

Synonyms:

- Cardiac TnT
- Cardiac Troponin T
- Troponin T
- TnT
- HS-TnT
- cardiac specific troponin
- LAB6028-VML
- LAB6028VML

SPECIMEN REQUIREMENTS

Collect:
Plasma Separator Tube (PST), or Green (Lithium Heparin).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens collected in potassium oxalate, sodium fluoride, or sodium citrate. Grossly hemolyzed specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 24 hours; Frozen: 1 year

Performed:
Mon, Wed, Fri

Tryptase

LAB827

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Tryptase, Autopsy (Tryptase)
- Total Tryptase
- LAB827-VML
- LAB827VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Allow serum to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 72 hours; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Tryptase, Autopsy (Tryptase)
- Total Tryptase
- LAB827-VML
- LAB827VML

Ordering Recommendations:
Measure total tryptase to confirm mast cell activation in diseases such as mastocytosis, anaphylaxis, urticaria, and asthma. Not generally used acutely except where diagnosis is unclear. Useful in prognosis of systemic mastocytosis.

Performed:
Sun-Sat

Methodology:
Quantitative Fluorescent Enzyme Immunoassay

Reported:
1-2 days

Notes:
This test measures total tryptase and does not distinguish between the alpha and beta protein types. Samples should preferably be collected between 15 minutes and three hours after the event suspected to have caused mast cell activation.

RESULTS INTERPRETATION

Reference Interval:
Less than 11.0 µg/L

Methodology:
Quantitative Fluorescent Enzyme Immunoassay

ADDITIONAL INFORMATION

CPT Codes:

Twin Zygosity

LAB6613

ORDERING INFO

Collect:
From each twin: Lavender (EDTA), pink (K2EDTA), or yellow (ACD solution A or B).

Synonyms:

- Newborn Zygosity
- Zygosity, Twin Pre/Postnatal
- Fetal Zygosity
- Mono/Dizygotic Differentiation
- LAB6613-VML
- LAB6613VML

SPECIMEN REQUIREMENTS

Collect:
From each twin: Lavender (EDTA), pink (K2EDTA), or yellow (ACD solution A or B).

Specimen Preparation:
From each twin: Transport 2 mL whole blood (Min: 1 mL)

Storage/Transport Temperature:
Refrigerated. Also acceptable: Ambient

Stability (from collection to initiation):
Room temperature: 1 week; Refrigerated: 1 month; Frozen: Unacceptable

Performed:
Varies

ORDERING

Synonyms:

- Newborn Zygosity
- Zygosity, Twin Pre/Postnatal
- Fetal Zygosity
- Mono/Dizygotic Differentiation
- LAB6613-VML
- LAB6613VML

Ordering Recommendations:
Use to determine zygosity.

Performed:
Varies

Methodology:
Polymerase Chain Reaction (PCR)/Fragment Analysis

Reported:
5-10 days

Notes:
Results from both twins will be compared and reported; therefore, a test must be ordered for and sample submitted from each individual.

RESULTS INTERPRETATION

Reference Interval:
By report.

Interpretive Data:
Refer to report.

Methodology:
Polymerase Chain Reaction (PCR)/Fragment Analysis

ADDITIONAL INFORMATION

CPT Codes:
81265

Section:
RF-ARUP

Notes:
Results from both twins will be compared and reported; therefore, a test must be ordered for and sample submitted from each individual.

Resulting Laboratory:

Type an Screen, blood

LAB276

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- TS, ABORh and Ab screen
- LAB276-VML
- LAB276VML

Turn Around Time:
STAT: 2 hours Routine: 4 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Refer to SOP: Labeling of Laboratory Specimens section III.C. for labeling requirements specific to Blood Bank Specimens.

Pediatric Collection:
Pediatric Lavendar tube (EDTA) Lavendar microtainer (EDTA)

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Ambient: (15-25°C): 3 days

Specimen:
Blood, plasma

Alternate Specimen:
Red tube (no gel)

ORDERING

Ordering Indicators:
Determine ABO and Rh (D) tying of patients for transfusion absence or presence of red blood cell antibodies prior to transfusion and in prenatal testing.

Synonyms:

- TS, ABORh and Ab screen
- LAB276-VML
- LAB276VML

Performed:
Daily

Turn Around Time:
STAT: 2 hours Routine: 4 hours

Methodology:
Agglutination and indirect antiglobulin testing

Components:
ABO and Rh blood type and antibody screen

RESULTS INTERPRETATION

Reference Interval:
NA

Interpretive Data:
NA

Methodology:
Agglutination and indirect antiglobulin testing

Unfractionated Heparin Level

LAB317

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB317, Unfractionated Heparin Level, Heparin Level, UFH, Anti-Xa Assay
- LAB317-VML
- LAB317VML

Turn Around Time:

2 hours once received into lab

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. Process the sample carefully to avoid platelet activation during centrifugation. PF-4 released from the platelet granules is a potent heparin inhibitor, and release of PF-4 may result in an underestimate of the UFH level. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB317, Unfractionated Heparin Level, Heparin Level, UFH, Anti-Xa Assay
- LAB317-VML
- LAB317VML

Performed:
Daily

Turn Around Time:
2 hours once received into lab

Methodology:
Chromogenic

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Therapeutic range 0.30 - 0.70 U/mL

Interpretive Data:
The UFH result is dependent on the concentration of antithrombin in the test plasma. Antithrombin deficiency may result in an undersestimation of the UFH level. Plasma hemoglobin levels of >150 mg/dL may result in an overestimation of the UFH level.

Methodology:
Chromogenic

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Oral anti-Xa inhibitors interfer with anti-Xa assays for UFH. Even at subtheraputic levels, anti-Xa inhibitors may result in an overestimation of the UFH level.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Urea Nitrogen, Plasma or Serum

LAB140

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- BUN, Urea Nitrogen Blood, Blood Urea Nitrogen, LAB140
- LAB140-VML
- LAB140VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.2 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 7 days; 2° to 8°C: 7 days; Frozen: 1 year

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:
N/A

Urinalysis with Microscopic

LAB348

ORDERING INFO

Collect:
Urine Yellow Top tube (no additive)

Synonyms:

- Urinalysis with microscopic, UA2, LAB348
- LAB348-VML
- LAB348VML

Turn Around Time:
Stat: 1 hour

SPECIMEN REQUIREMENTS

Patient Preparation:
The patient must be given instructions for collecting "clean catch" urine

Collect:
Urine Yellow Top tube (no additive)

Specimen Preparation:
Send to lab immediately. Test must be performed within 2 hours of collection. Refrigerate if testing delayed >2 hrs. Specify whether or not it is a catheterized specimen. Specimen good for 24 hours if refrigerated, although there may be some cellular degredation after 4 hours of collection.

Pediatric Collection:
Pediatrics: 3 ml sterile urine

Storage/Transport Temperature:
Refrigerated

Performed:
Daily

Stability:
15° to 25°C: 2 hours; 2° to 8°C: 24 hours. Bring to Room Temp before testing

Specimen:
Urine

Alternate Specimen:
Urine Yellow; Sterile Container without Additive

ORDERING

Ordering Indicators:
UTI, kidney disorder, liver conditions, diabetes, other metabolic conditions

Synonyms:

- Urinalysis with microscopic, UA2, LAB348
- LAB348-VML
- LAB348VML

Performed:
Daily

Turn Around Time:
Stat: 1 hour

Methodology:
Dipstick, refractometer and visual exam

Components:
Color, Appearance, Specific Gravity, pH, Glucose, Protein, Ketone, Bilirubin, Urobilinogen, Leukocyte Esterase, Blood, Nitrite; Microscopic

RESULTS INTERPRETATION

Reference Interval:
Specific gravity: 1.015-1.025, dipstick: pH: 5.0-7.0, URO: 0.1-1.0 EU/dL or <2.0 mg/dL. All other urine Chemistries: Negative, Microscopic: WBC: 0-10 /HPF, RBC: 0-4 /HPF. All other microscopic: None / HPF.

Interpretive Data:
N/A

Methodology:
Dipstick, refractometer and visual exam

ADDITIONAL INFORMATION

URINARY TRACT CYTOLOGY

LAB14

ORDERING INFO

Collect:
Clean specimen container, or Cytolyt collection cup (provided by Cytology lab)

Synonyms:

- NGY, Renal Pelvic, Urine, Catheterized urine, Bladder lavage, Bladder washing
- LAB14-VML
- LAB14VML

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container, or Cytolyt collection cup (provided by Cytology lab)

Specimen Preparation:
1. Specimen is collected in a clean specimen container or cytolyt collection cup (min 1mL). 2. Place Epic order for Cytology Urine. 3. Indicate specimen source and laterality and method of collection (i.e. voided urine, bladder washing, urostomy urine) when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minmum: 100 mL is optimal)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Specimen in clean specimen container or Cytolyt collection cup

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
COLLECTION METHOD MUST BE PROVIDED, please include patient's history of malignancy, kidney stones and/or other urogenital disorders.

Synonyms:

- NGY, Renal Pelvic, Urine, Catheterized urine, Bladder lavage, Bladder washing
- LAB14-VML
- LAB14VML

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor. Adequacy is determined by the Paris System.

Methodology:
ThinPrep procedure

Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Synonyms:

- NGY, Renal Pelvic, Urine, Catheterized urine, Bladder lavage, Bladder washing
- LAB14-VML
- LAB14VML

Performed:
Monday-Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
4 Days

Ordering Indicators:
COLLECTION METHOD MUST BE PROVIDED, please include patient's history of malignancy, kidney stones and/or other urogenital disorders.

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor. Adequacy is determined by the Paris System.

Reference Interval:
Not established for this test

Additional Information:
N/A

Methodology:
ThinPrep procedure

Section:
Cytology

Urine Amino Acid Screen, urine

LAB562

ORDERING INFO

Collect:
Urine Clear

Synonyms:

- LAB562, AAU, Amino Acid Urine
- LAB562-VML
- LAB562VML

Turn Around Time:
3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Urine Clear

Specimen Preparation:
Spot urine sample should be collected without preservatives. (Minimum 0.5 mL urine)

Pediatric Collection:
Urine Clear

Storage/Transport Temperature:
Frozen (-20°C)

Performed:
Monday - Friday

Stability:
Frozen (-20°C): 6 months

Specimen:
Urine

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is used in the diagnosis and monitoring of lysinuric protein intolerance, cystinuria, and homocystinuria.

Synonyms:

- LAB562, AAU, Amino Acid Urine
- LAB562-VML
- LAB562VML

Performed:
Monday - Friday

Turn Around Time:
3 days

Methodology:
Liquid chromatography/tandem mass spectrometry

Components:
Urine Creatinine, Hydroxyproline, Histidine, Asparagine, 3-Methylhistidine, Taurine, 1-Methylhistidine, Serine, Glutamine, Arginine, Glycine, Aspartic Acid, Glutamic Acid, Citrulline, Threonine, Alanine, Gamma Aminobutyric Acid, Ornithine, Cystine, Lysine, Tyrosine, Methionine, Valine, Isoleucine, Leucine, Homocystine, Phenylalanine, Miscellaneous Amino Acid

RESULTS INTERPRETATION

Reference Interval:
Supplied with results

Interpretive Data:
Amino acids appear in excessive amounts in urine for several reasons: Overflow- plasma concentration is high and exceeds the capacity of the renal tubular re-uptake mechanism and the excess appears in urine No threshold- excess amino acid is present, but all is excreted, so plasma concentration is normal Proximal renal tubular malfunction- genetic defect in proximal tubular (and GI uptake) trasporter systems or acquired damage to tubules reduces the ability to re-absorb filtered amino acids

Methodology:
Liquid chromatography/tandem mass spectrometry

ADDITIONAL INFORMATION

Section:
Special Chemistry

Alternate Specimen:
N/A

Additional Information:
Urine amino acid concentratios are corrected for creatinine content. If the urine creatinine is < 5, then the specimen will be rejected and commented as "Urine specimen too dilute to calculate urine amino acid ratio".

Components:
Urine Creatinine, Hydroxyproline, Histidine, Asparagine, 3-Methylhistidine, Taurine, 1-Methylhistidine, Serine, Glutamine, Arginine, Glycine, Aspartic Acid, Glutamic Acid, Citrulline, Threonine, Alanine, Gamma Aminobutyric Acid, Ornithine, Cystine, Lysine, Tyrosine, Methionine, Valine, Isoleucine, Leucine, Homocystine, Phenylalanine, Miscellaneous Amino Acid

Urine Bilirubin by Dipstick or Ictotest

LAB369

ORDERING INFO

Collect:
Urine Yellow Top tube (no additive)

Synonyms:

- BIL, Bilirubin urine, U Bili, UR Bilirubin, LAB369
- LAB369-VML
- LAB369VML

Turn Around Time:
Stat: 1 hour

SPECIMEN REQUIREMENTS

Patient Preparation:
The Patient Must Be Given Instructions for collecting "clean catch" Urine

Collect:
Urine Yellow Top tube (no additive)

Specimen Preparation:
Collection of clean catch random urine in Yellow Top BD vacutainer tube containing no preservative (Min 1.0ml urine). Refrigerate if testing delayed >2 hours.

Pediatric Collection:
Pediatrics: 1 ml sterile urine

Storage/Transport Temperature:
Refrigerated

Performed:
Daily

Stability:
15° to 25°C: 2 hours; 2° to 8°C: 24 hours. Bring to Room Temp before testing

Specimen:
Urine

Alternate Specimen:
Urine Yellow; Sterile Container without Additive

ORDERING

Ordering Indicators:
Liver conditions, hemolysis

Synonyms:

- BIL, Bilirubin urine, U Bili, UR Bilirubin, LAB369
- LAB369-VML
- LAB369VML

Performed:
Daily

Turn Around Time:
Stat: 1 hour

Methodology:
Dipstick,Ictotest

Components:
Urine Bilirubin, Positive or Negative

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Food dyes or theraputic pigments may interfere with test pad coloration; elevated nitrite may inhibit reaction

Methodology:
Dipstick,Ictotest

Urine Pregnancy Test

LAB437

ORDERING INFO

Collect:
Urine Yellow Top tube (no additive)

Synonyms:

- UCG, PREGNANCY TEST URINE, Urine HCG, Beta HCG urine
- LAB437-VML
- LAB437VML

Turn Around Time:
1 hour

SPECIMEN REQUIREMENTS

Patient Preparation:
The Patient Must Be Given Instructions for collecting "clean catch" Urine

Collect:
Urine Yellow Top tube (no additive)

Specimen Preparation:
First morning specimen preferred.

Pediatric Collection:
Pediatrics: 1mL minimum

Storage/Transport Temperature:
Refrigerated

Performed:
Daily

Stability:
15° to 25°C: 2 hours; 2° to 8°C: 24 hours. Bring to Room Temp before testing

Specimen:
Urine, First Morning Specimen Preferred.

Alternate Specimen:
Yellow top urine, no additive; no additive vacutainer

ORDERING

Ordering Indicators:
N/A

Synonyms:

- UCG, PREGNANCY TEST URINE, Urine HCG, Beta HCG urine
- LAB437-VML
- LAB437VML

Performed:
Daily

Turn Around Time:
1 hour

Methodology:
Kit Test

Components:
Qualititive, reported as positive or negative

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Hook effect may occur in high concentration

Methodology:
Kit Test

ADDITIONAL INFORMATION

Section:
Urinalysis / Body Fluids

Alternate Specimen:
Yellow top urine, no additive; no additive vacutainer

Additional Information:
N/A

Components:
Qualititive, reported as positive or negative

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Urine Yellow Top tube (no additive)

Specimen Preparation:
First morning specimen preferred.

Pediatric Collection:
Pediatrics: 1mL minimum

Preferred Collection Volume:
12mL of fresh urine

Alternate Specimen:
Yellow top urine, no additive; no additive vacutainer

Patient Preparation:
The Patient Must Be Given Instructions for collecting "clean catch" Urine

Specimen:
Urine, First Morning Specimen Preferred.

Reasons for Rejection:
QNS, Contamination of Specimen from UA Analyzer, Specimen Age

Components:
Qualititive, reported as positive or negative

Stability:
15° to 25°C: 2 hours; 2° to 8°C: 24 hours. Bring to Room Temp before testing

Urine Specific Gravity by Dipstick or Refractometer

LAB4071

ORDERING INFO

Collect:
Urine Yellow Top tube (no additive)

Synonyms:

- U SpGrav, Specific Gravity Urine, UR Specific Gravity, SGU, LAB4071
- LAB4071-VML
- LAB4071VML

Turn Around Time:
Stat: 1 hour

SPECIMEN REQUIREMENTS

Patient Preparation:
The Patient Must Be Given Instructions for collecting "clean catch" Urine

Collect:
Urine Yellow Top tube (no additive)

Specimen Preparation:
Collection of clean catch random urine in Yellow Top BD vacutainer tube containing no preservative (Min 1.0ml urine). Refrigerate if testing delayed >2 hours.

Pediatric Collection:
Pediatrics: 1 ml sterile urine

Storage/Transport Temperature:
Refrigerated

Performed:
Daily

Stability:
15° to 25°C: 2 hours; 2° to 8°C: 24 hours

Specimen:
Urine

Alternate Specimen:
Urine Yellow; Sterile Container without Additive

ORDERING

Ordering Indicators:
Diabetes insipidus, diabetes mellitus, diarrea, fever, sweating, vomiting, glomerulonephritis, hypertention, pyelonephritis, hydration status

Synonyms:

- U SpGrav, Specific Gravity Urine, UR Specific Gravity, SGU, LAB4071
- LAB4071-VML
- LAB4071VML

Performed:
Daily

Turn Around Time:
Stat: 1 hour

Methodology:
Refractometer

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
1.015 - 1.025

Interpretive Data:
Radiopaque x-ray contrast media can greatly increase specific gravity readings, a comment reading "Interfering substance present" will be attached to readings >1.050.

Methodology:
Refractometer

ADDITIONAL INFORMATION

Urine Volatile Screen, urine

LAB751

ORDERING INFO

Collect:
Urine Clear

Synonyms:

- LAB751, DSV, Alcohol Screen
- LAB751-VML
- LAB751VML

Turn Around Time:
6 hours after sample received in lab

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Urine Clear

Specimen Preparation:
Sample should be a random, clean catch urine. Send to the lab immediately. (Minimum 0.5 mL urine)

Pediatric Collection:
Urine Clear

Storage/Transport Temperature:
Refrigerated (2-8°C) if not delivered to the lab immediately

Performed:
Daily

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Urine

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is used as an initial screen to check for the presence of acetone, methanol, isopropanol, and/or ethanol in the patient.

Valproic Acid, Free and Total

LAB6147

ORDERING INFO

Collect:
Plain red.

Synonyms:

- Depakene, Free
- Free Valproate
- Free Valproic Acid
- Dipropylacetic Acid
- Eplim
- Free VPA
- Orlept
- Protein Free Valproic Acid
- Stavzor, Free
- Valproate
- valproic acid blood level
- VPA blood level
- Depacon
- Depakote, Free
- LAB6147-VML
- LAB6147VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red.

Specimen Preparation:
Separate serum from cells within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Light blue (citrate), gray (oxalate), green (heparin), K_2EDTA plasma, tubes that contain liquid anticoagulant, or gel separator tubes.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- Depakene, Free
- Free Valproate
- Free Valproic Acid
- Dipropylacetic Acid
- Eplim
- Free VPA
- Orlept
- Protein Free Valproic Acid
- Stavzor, Free
- Valproate
- valproic acid blood level
- VPA blood level
- Depacon
- Depakote, Free
- LAB6147-VML
- LAB6147VML

Ordering Recommendations:
Preferred test for therapeutic drug management in patients with renal failure or conditions that may alter albumin concentrations.

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme Multiplied Immunoassay Technique

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:

Components	Therapeutic Range
Valproic Acid, Total	Therapeutic Range: 50-125 µg/mL Toxic: Greater than 150 µg/mL
Valproic Acid, Free	Effective November 18, 2013 Therapeutic Range: 7-23 µg/mL Toxic: Greater than 30 µg/mL
Valproic Acid, Percent Free	5-18 percent

Interpretive Data:
Free valproic acid may be important to monitor in patients with altered or unpredictable protein binding capacity because valproic acid exhibits variable, dose-dependent protein binding. Valproic acid is also subject to drug-drug interactions due to displacement of protein binding. Calculating percent free attempts to minimize differences in test cross-reactivity and may be useful in dose optimization. Adverse effects may include headache, somnolence and dizziness.

Methodology:
Quantitative Enzyme Multiplied Immunoassay Technique

Vanillylmandelic Acid (VMA), Urine

LAB750

ORDERING INFO

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Synonyms:

- 4-Hydroxy-3-Methoxymandelic Acid
- 3-Methoxy-4-Hydroxy-Mandelic Acid
- 3-Methoxy-4-Hydroxymandelic Acid
- VMA
- LAB750-VML
- LAB750VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Abstain from medications for 72 hours prior to collection.

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:
Transfer 4 mL aliquot from a well-mixed 24-hour or random collection to an ARUP Standard Transport Tube. (Min: 1 mL) Record total volume and collection time interval on transport tube and test request form.

Unacceptable Conditions:
Specimen types other than urine.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 2 weeks

Performed:
Sun, Tue, Wed, Thu, Fri, Sat

ORDERING

Synonyms:

- 4-Hydroxy-3-Methoxymandelic Acid
- 3-Methoxy-4-Hydroxy-Mandelic Acid
- 3-Methoxy-4-Hydroxymandelic Acid
- VMA
- LAB750-VML
- LAB750VML

Ordering Recommendations:
Initial test for the diagnosis and monitoring of neuroblastoma. Should be ordered concurrently with Homovanillic Acid (HVA), Urine (0080422).

Performed:
Sun, Tue, Wed, Thu, Fri, Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Moderately elevated VMA (vanillylmandelic acid) can be caused by a variety of factors such as essential hypertension, intense anxiety, intense physical exercise, and numerous drug interactions (including some over-the-counter medications and herbal products).

Medications that may interfere with catecholamines and their metabolites include amphetamines and amphetamine-like compounds, appetite suppressants, bromocriptine, buspirone, caffeine, chlorpromazine, clonidine, disulfiram, diuretics (in doses sufficient to deplete sodium), epinephrine, glucagon, guanethidine, histamine, hydrazine derivatives, imipramine, levodopa (L-dopa, Sinemet®), lithium, MAO inhibitors, melatonin, methyldopa (Aldomet®), morphine, nitroglycerin, nose drops, propafenone (Rythmol), radiographic agents, rauwolfia alkaloids (Reserpine), tricyclic antidepressants, and vasodilators. The effects of some drugs on catecholamine metabolite results may not be predictable.

RESULTS INTERPRETATION

Reference Interval:

<table>
<tr><th>Components</th><th>Reference Interval</th></tr>
<tr><td>Creatinine, Urine - per 24h</td><td>
<table>
<tr><th>Age</th><th>Male (mg/d)</th><th>Female (mg/d)</th></tr>
<tr><td>3-8 years</td><td>140-700</td><td>140-700</td></tr>
<tr><td>9-12 years</td><td>300-1300</td><td>300-1300</td></tr>
<tr><td>13-17 years</td><td>500-2300</td><td>400-1600</td></tr>
<tr><td>18-50 years</td><td>1000-2500</td><td>700-1600</td></tr>
<tr><td>51-80 years</td><td>800-2100</td><td>500-1400</td></tr>
<tr><td>81 years and older</td><td>600-2000</td><td>400-1300</td></tr>
</table>
</td></tr>

<tr><td>6-17 years</td><td>0-9</td></tr>
<tr><td>18 years and older</td><td>0-6</td></tr>
</table>
</td></tr>
</table>

Interpretive Data:

Vanillylmandelic acid (VMA) results are expressed as a ratio to creatinine excretion (mg/g CRT). No reference interval is available for results reported in units of mg/L. Slight or moderate increases in catecholamine metabolites may be due to extreme anxiety, essential hypertension, intense physical exercise, or drug interactions. Significant increase of one or more catecholamine metabolites (several times the upper reference limit) is associated with an increased probability of a secreting neuroendocrine tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

ARUP Laboratories

FULL VIEW

Collect:

24-hour or random urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:
Transfer 4 mL aliquot from a well-mixed 24-hour or random collection to an ARUP Standard Transport Tube. (Min: 1 mL) Record total volume and collection time interval on transport tube and test request form.

Patient Preparation:
Abstain from medications for 72 hours prior to collection.

Unacceptable Conditions:
Specimen types other than urine.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 2 weeks

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- 4-Hydroxy-3-Methoxymandelic Acid
- 3-Methoxy-4-Hydroxy-Mandelic Acid
- 3-Methoxy-4-Hydroxymandelic Acid
- VMA
- LAB750-VML

Varicella-Zoster Virus (VZV) Qualitative PCR

LAB1372

ORDERING INFO

Collect:
Blood: Lavender tube (EDTA); Swab: Universal /Viral Transport Media (UTM/VTM); CSF: Sterile Container

Synonyms:

- LAB1372, Varicella Zoster Virus, VZD, VZV DNA PCR
- LAB1372-VML
- LAB1372VML

Turn Around Time:
1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Blood: Lavender tube (EDTA); Swab: Universal /Viral Transport Media (UTM/VTM); CSF: Sterile Container

Specimen Preparation:
Blood: draw 4.0ml of whole blood (Lavender tube [EDTA]), deliver to lab within 24hrs at Ambient (15-25°C). Swab: Swab site and place in either UTM or VTM, deliver to lab within 24hrs at Ambient (15-25°C). CSF: Collect in sterile container and deliver to lab within 24hrs at Ambient (15-25°C). (Min 1.0mL Plasma), (Min 0.2mL UTM/VTM), (Min 0.2mL CSF)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Blood: Ambient (15-25°C); Swabs: Ambient (15-25°C). CSF: Ambient (15-25°C)

Performed:
Tuesday, Thursday, Saturday

Stability:
Blood: Up to 24 hours at Ambient (15-25°C), 6 days at Refrigerated (2-8°C) once spun and plasma separated. Swabs: collected in UTM or VTM within 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C). CSF: 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C), 4 weeks at Frozen (<=-20°C).

Specimen:
Blood in a Lavender tube (EDTA); Swab collected in UTM/VTM; CSF

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
Varicella-zoster virus (VZV) is responsible for common childhood varicella (chickenpox) and adult-onset zoster (shingles). Testing is indicated for active cutaneous lesions and not as a screening test. CSF and serum testing should be reserved to clinically evaluate for disseminated zoster.

Synonyms:

- LAB1372, Varicella Zoster Virus, VZD, VZV DNA PCR
- LAB1372-VML

Varicella-Zoster Virus Antibody, IgM

LAB3854

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Herpes Zoster IgM antibodies
- Varicella Zoster Virus IgM
- VZV Antibody, IgM
- VZV IgM
- Varicella-Zoster Virus Antibody, IgM, Serum
- Herpes Zoster
- LAB3854-VML
- LAB3854VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon-Fri

ORDERING

Synonyms:

- Herpes Zoster IgM antibodies
- Varicella Zoster Virus IgM
- VZV Antibody, IgM
- VZV IgM
- Varicella-Zoster Virus Antibody, IgM, Serum
- Herpes Zoster
- LAB3854-VML
- LAB3854VML

Ordering Recommendations:
Panel that combines varicella-zoster virus IgG and IgM antibodies is preferred (0050162).

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
0.90 ISR or less: Negative - No significant level of detectable varicella-zoster virus IgM antibody.
0.91-1.09 ISR: Equivocal - Repeat testing in 10-14 days may be helpful.
1.10 ISR or greater: Positive - Significant level of detectable varicella-zoster virus IgM antibody. Indicative of current or recent infection. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection or immunization.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Three 2.7 mL Light blue tubes (3.2% Sodium Citrate). Neonate: Three 1.8mL Light blue tubes (3.2% Sodium Citrate).

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:
Pediatric: Three 2.7 mL Light blue tubes (3.2% Sodium Citrate). Neonate: Three 1.8mL Light blue tubes (3.2% Sodium Citrate).

Storage/Transport Temperature:
Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:
Twice per week - variable days

Stability:
Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:
Citrated platelet poor plasma.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
N/A

Synonyms:

- LAB5451, VTH, Hypercoagulable State Panel for Venous Thromboembolism
- LAB5451-VML
- LAB5451VML

Performed:
Twice per week - variable days

Turn Around Time:
1 - 6 days

Methodology:
Clotting/Chromogenic/Immunoturbidimetric/ELISA

Components:
PT/INR, PTT, TT, LMWH, PC and S activity, AT activity, FVL, G20210A. Reflex to FVL Mutation & AT, Protein C & S (free) antigens as needed.

RESULTS INTERPRETATION

Reference Interval:
Refer to the individual assays.

Interpretive Data:
Direct IIa (thrombin) inhibitors and both direct and indirect Xa inhibitors may interfer with the assay. The presence of Hemlibra (emicizumab) may affect the assay for protein S activity and activated protein C resistance (FVL). Patients on warfarin may have decrease protein C and protein S levels. Protein S levels may be decreased in pregnancy, imflammatory syndromes, liver dysfunction, and DIC.

Methodology:
Clotting/Chromogenic/Immunoturbidimetric/ELISA

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Request for in-patient testing must be approved by the Coagulation Medical Director on-call. (Refer to Synergy for contact informtation.) Request for testing can be submitted via the following link: redcap.link/misc-coag.

Components:
PT/INR, PTT, TT, LMWH, PC and S activity, AT activity, FVL, G20210A. Reflex to FVL Mutation & AT, Protein C & S (free) antigens as needed.

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Three 2.7 mL Light blue tubes (3.2% Sodium Citrate). Neonate: Three 1.8mL Light blue tubes (3.2% Sodium Citrate).

Specimen Preparation:

Very Long-Chain and Branched-Chain Fatty Acids Profile

LAB987

ORDERING INFO

Collect:
Green (sodium or lithium heparin) or lavender (EDTA).

Synonyms:

- VLCFA and BCFA
- LAB987-VML
- LAB987VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Adults: Fasting specimen preferred.
Infants and children: Draw specimen prior to feeding or 2-3 hours after a meal.

Collect:
Green (sodium or lithium heparin) or lavender (EDTA).

Specimen Preparation:
Separate plasma from cells. Transfer 0.5 mL plasma to an ARUP standard transport tube and freeze immediately. (Min: 0.2 mL)

Unacceptable Conditions:
Room temperature specimens greater than 24 hours. Refrigerated specimens greater than 48 hours. Specimens exposed to more than one freeze/thaw cycle.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 72 hours; Frozen: 1 month

Performed:
Tue, Thu

Remarks:
Clinical information is needed for appropriate interpretation. Additional required information includes age, gender, diet (e.g.,TPN therapy), drug therapy, and family history. Biochemical Genetics Patient History Form is available on the ARUP Web site at http://www.aruplab.com/patienthistory or by contacting ARUP Client Services.

ORDERING

Synonyms:

- VLCFA and BCFA
- LAB987-VML
- LAB987VML

Ordering Recommendations:
Initial test to screen for disorders of peroxisomal biogenesis and/or function, including X-linked adrenoleukodystrophy and Zellweger syndrome. This test does not detect essential fatty acid deficiency and should not be used to evaluate nutritional status.

Performed:
Tue, Thu

Methodology:
Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-9 days

Viscosity, Serum

LAB765

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- VIS, Serum viscocity
- LAB765-VML
- LAB765VML

Turn Around Time:
Stat: 1 hour; Routine: 4 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Red tube (no gel)

Specimen Preparation:
>1 ml of serum, please fill red top tube completely

Pediatric Collection:
Two Red microtainers (no gel)

Storage/Transport Temperature:
Room Temperature

Performed:
Daily

Stability:
Room Temperature

Specimen:
Serum

Alternate Specimen:
Lavender top (EDTA)

ORDERING

Ordering Indicators:
To look for abnormal/excessive proteins in the serum to cause it to be viscous, such as in Multiple Myeloma

Synonyms:

- VIS, Serum viscocity
- LAB765-VML
- LAB765VML

Performed:
Daily

Turn Around Time:
Stat: 1 hour; Routine: 4 hours

Methodology:
Ratio of serum vs H2O in seconds

Components:
Relative viscocity is measured as patient results in seconds divided by water measured in seconds using a red cell pipette

RESULTS INTERPRETATION

Reference Interval:
1.4 - 1.8

Interpretive Data:
N/A

Methodology:
Ratio of serum vs H2O in seconds

ADDITIONAL INFORMATION

Section:
Hematology

Vitamin A (Retinol), Serum or Plasma

LAB580

ORDERING INFO

Collect:
Green (sodium or lithium heparin), plasma separator tube, or serum separator tube. Also acceptable: Lavender (EDTA) or pink (K_2EDTA).

Synonyms:

- A Vitamin
- Retinol
- Retinyl palmitate
- LAB580-VML
- LAB580VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should fast for 12 hours and abstain from alcohol for 24 hours prior to collection.

Collect:
Green (sodium or lithium heparin), plasma separator tube, or serum separator tube. Also acceptable: Lavender (EDTA) or pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma within 1 hour of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube immediately. (Min: 0.2 mL) Avoid hemolysis.

Unacceptable Conditions:
Whole blood or body fluids other than serum or plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 3 hours; Refrigerated: 1 month; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- A Vitamin
- Retinol
- Retinyl palmitate
- LAB580-VML
- LAB580VML

Ordering Recommendations:
Use for nutritional assessment of vitamin A (retinol and retinyl palmitate) in serum or plasma.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
1-4 days

Notes:
Serum retinol is typically maintained until hepatic stores are almost depleted. Values greater than 0.30 mg/L represent adequate liver stores, whereas values less than 0.10 mg/L indicate deficiency. Samples that come in contact with plastic tubing or have been exposed to excessive light may show low results.

Vitamin A toxicity occurs when retinol concentration exceeds the capacity of retinol binding protein (RBP). Individuals with compromised renal function can retain RBP and may, therefore, have moderate retinol elevations. Drugs which interfere with vitamin A analysis include probucol (Lorelco).

This assay does not measure other vitamin A metabolites such as retinaldehyde and retinoic acid.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Vitamin A (Retinol)	**Age** / **Reference Interval** 0-1 month: 0.18-0.50 mg/L 2 months-12 years: 0.20-0.50 mg/L 13-17 years: 0.26-0.70 mg/L 18 years and older: 0.30-1.20 mg/L
Vitamin A (Retinyl Palmitate)	0-150 years: 0-0.10 mg/L

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative High Performance Liquid Chromatography (HPLC)

ADDITIONAL INFORMATION

CPT Codes:

84590

Vitamin B_1 (Thiamine), Plasma

LAB125

ORDERING INFO

Collect:
Green (sodium or lithium heparin), lavender (EDTA), plasma separator tube, or pink (K2 EDTA).

Synonyms:

- B1 Vitamin
- Thiamine
- Vitamin B1 (Thiamine),
- VITB1
- LAB125-VML
- LAB125VML

SPECIMEN REQUIREMENTS

Collect:
Green (sodium or lithium heparin), lavender (EDTA), plasma separator tube, or pink (K2 EDTA).

Specimen Preparation:
Separate plasma from cells within one hour of collection. Transfer 1 mL plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Hemolyzed specimens or specimens other than heparin or EDTA plasma.

Storage/Transport Temperature:
Frozen. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 week; Frozen at -20°C: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- B1 Vitamin
- Thiamine
- Vitamin B1 (Thiamine),
- VITB1
- LAB125-VML
- LAB125VML

Ordering Recommendations:
Do not use for evaluation of thiamine sufficiency. Refer to Vitamin B1 (Thiamine), Whole Blood (0080388) for nutritional assessment of thiamine.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)

Reported:
2-4 days

Notes:
Whole blood is the preferred specimen for thiamine assessment. Approximately 80 percent of thiamine present in whole blood is found in red blood cells. Refer to Vitamin B1 (Thiamine), Whole Blood (0080388).

RESULTS INTERPRETATION

Reference Interval:
4-15 nmol/L

Interpretive Data:
Thiamine (vitamin B1) is reported. However, thiamine diphosphate (TDP), the biologically active form of thiamine, is not found in measurable concentrations in plasma, and is best determined in whole blood specimens. Plasma thiamine concentration reflects recent intake rather than body stores.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Vitamin B_1 (Thiamine), Whole Blood

LAB745

ORDERING INFO

Collect:
Green (sodium or lithium heparin), lavender (EDTA), or pink (K2EDTA).

Synonyms:

- B1 Vitamin
- TDP
- Thiamine
- Thiamine Diphosphate
- Thiamine Pyrophosphate
- VITB1
- TPP
- LAB745-VML
- LAB745VML

SPECIMEN REQUIREMENTS

Collect:
Green (sodium or lithium heparin), lavender (EDTA), or pink (K2EDTA).

Specimen Preparation:
Transfer 3 mL whole blood to an ARUP standard transport tube (Min: 0.6 mL) and freeze within 1 hour of collection.

Unacceptable Conditions:
Any specimen other than whole blood. Plasma separator tubes. Glass tubes. Clotted or nonfrozen specimens.

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
Room Temperature: Unacceptable; Refrigerated: Unacceptable; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- B1 Vitamin
- TDP
- Thiamine
- Thiamine Diphosphate
- Thiamine Pyrophosphate
- VITB1
- TPP
- LAB745-VML
- LAB745VML

Ordering Recommendations:
Use for nutritional assessment of vitamin B1 (thiamine).

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)/Liquid Chromatography-Tandem Mass Spectrometry

Reported:
2-5 days

Notes:
Whole blood is the preferred specimen for thiamine assessment. Approximately 80 percent of thiamine present in whole blood is found in red blood cells.

RESULTS INTERPRETATION

Reference Interval:
70-180 nmol/L

Interpretive Data:
This assay measures the concentration of thiamine diphosphate (TDP), the primary active form of vitamin B1. Approximately 90 percent of vitamin B1 present in whole blood is TDP. Thiamine and thiamine monophosphate, which comprise the remaining 10 percent, are not measured.

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)/Liquid Chromatography-Tandem Mass Spectrometry

Vitamin B_6 (Pyridoxal 5-Phosphate)

LAB120

ORDERING INFO

Collect:
Green (Sodium or Lithium Heparin), Lavender (EDTA), Pink (K2 EDTA), Plasma Separator Tube (PST), Serum Separator Tube (SST), or Plain Red.

Synonyms:

- P 5-P
- Pyridoxal Phosphate
- LAB120-VML
- LAB120VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect specimen after an overnight fast.

Collect:
Green (Sodium or Lithium Heparin), Lavender (EDTA), Pink (K2 EDTA), Plasma Separator Tube (PST), Serum Separator Tube (SST), or Plain Red.

Specimen Preparation:
Separate plasma or serum from cells, protect from light and transfer 1 mL plasma or serum to an ARUP Amber Transport Tube within 1 hour of collection. (Min: 0.5 mL) Separate light-protected specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Whole blood. Specimens not protected from light. Icteric specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 3 Hours; Refrigerated: 1 week; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- P 5-P
- Pyridoxal Phosphate
- LAB120-VML
- LAB120VML

Ordering Recommendations:
Use for nutritional assessment of vitamin B6.

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
This test measures pyridoxal 5-phosphate, the biologically active form of vitamin B6.

RESULTS INTERPRETATION

Reference Interval:
20-125 nmol/L

Interpretive Data:
Pyridoxal 5'-phosphate measured in a specimen collected following an 8 hour or overnight fast accurately indicates vitamin B_6 nutritional status. Non-fasting specimen concentration reflects recent vitamin intake.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Vitamin B7, Serum or Plasma

LAB6611

ORDERING INFO

Collect:
Plain red or lavender (K2EDTA)

Synonyms:

- Biotin
- LAB6611-VML
- LAB6611VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or lavender (K2EDTA)

Specimen Preparation:
Transfer 1 mL serum or plasma to an ARUP standard transport tube (Min: 0.5 mL).
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Separator tubes

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 72 hours; Frozen: 2 weeks

Performed:
Varies

ORDERING

Synonyms:

Vitamin C (Ascorbic Acid), Plasma

LAB671

ORDERING INFO

Collect:
Green (sodium or lithium heparin). Place specimen in ice bath immediately. Also acceptable: Plasma separator tube.

Synonyms:

- Ascorbate
- LAB671-VML
- LAB671VML

SPECIMEN REQUIREMENTS

Collect:
Green (sodium or lithium heparin). Place specimen in ice bath immediately. Also acceptable: Plasma separator tube.

Specimen Preparation:
Protect from light, centrifuge, transfer plasma, and freeze within 1 hour of collection. Transfer 0.5 mL plasma to an ARUP amber transport tube. (Min: 0.3 mL)

Unacceptable Conditions:
EDTA plasma, whole blood, or body fluids. Grossly hemolyzed specimens.

Storage/Transport Temperature:
CRITICAL FROZEN AND LIGHT PROTECTED. Separate specimens must be submitted when multiple tests are ordered

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 month

Performed:
Sun-Sat

Remarks:
Thawing and refreezing of the specimen and exposure to light will result in decreased vitamin C concentration.

ORDERING

Synonyms:

- Ascorbate
- LAB671-VML
- LAB671VML

Ordering Recommendations:
Use for nutritional assessment of vitamin C.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

Notes:
Fasting specimen preferred. Thawing and refreezing of the specimen and exposure to light will result in decreased vitamin C concentration.

RESULTS INTERPRETATION

Reference Interval:
23-114 µmol/L

Interpretive Data:
Vitamin C concentrations lower than 11 umol/L indicate deficiency. Concentrations between 11 and 23 umol/L are consistent with a moderate risk of deficiency due to inadequate tissue stores.

Vitamin C concentration is reported as micromoles per liter (umol/L). To convert concentration to milligrams per deciliter (mg/dL), multiply the result by 0.0176.

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

ADDITIONAL INFORMATION

CPT Codes:
82180

Section:
RF-ARUP

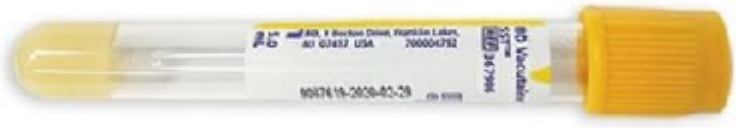
Vitamin D Total, Serum (25-Hydroxyvitamin D)

LAB3418

ORDERING INFO

Collect:

Gold (Clot Activator with Gel)



Synonyms:

- TVD, 25 - Hydroxy - Vitamin D, Total Vitamin D, Vitamin D, 25-OH, Total, LAB3418
- LAB3418-VML
- LAB3418VML

Turn Around Time:

STAT: 1 Hour, Routine: 2 Hours

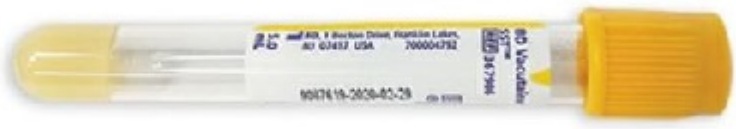
SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Gold (Clot Activator with Gel)



Specimen Preparation:

Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.3 mL)

Pediatric Collection:

1 Gold Microtainer (Clot Activator with Gel)

Storage/Transport Temperature:

Refrigerated: 2° to 8°C

Performed:

Daily

Stability:

After separation from cells: 15° to 25°C: 72 hours; 2° to 8°C: 12 days; Frozen -20°C 1 year

Specimen:

Serum

Alternate Specimen:

Red (No Gel)

ORDERING

Ordering Indicators:

This test is appropriate for screening for 25-OH vitamin D status, diagnosis of vitamin D deficiency or toxicity, and/or monitoring of Vitamin D supplementation. <10 ng/mL (severe deficiency), 10-24 ng/mL (mild to moderate deficiency), 25-80 ng/mL (optimum levels), >80 ng/mL (toxicity possible).

Synonyms:

- TVD, 25 - Hydroxy - Vitamin D, Total Vitamin D, Vitamin D, 25-OH, Total, LAB3418
- LAB3418-VML
- LAB3418VML

Vitamin D, 1, 25-Dihydroxy

LAB536

ORDERING INFO

Collect:
Serum separator tube or plain red, lithium heparin or EDTA plasma.

Synonyms:

- 1,25-Dihydroxyvitamin D3
- Calcitriol
- D, 1-25 Dihydroxy, Vitamin
- 1,25-Dihydroxy Vitamin D
- 1,25-Dihydroxyvitamin D
- 1,25-(OH)2-D
- 1,25-Dihydroxycholecalciferol
- Vit D 1,25
- LAB536-VML
- LAB536VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plain red, lithium heparin or EDTA plasma.

Specimen Preparation:
Allow serum separator or plain red tube to sit for 15-20 minutes at room temperature for proper clot formation. Centrifuge and separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)
Storage/Transport Temperature: Refrigerated.

Unacceptable Conditions:
Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- 1,25-Dihydroxyvitamin D3
- Calcitriol
- D, 1-25 Dihydroxy, Vitamin
- 1,25-Dihydroxy Vitamin D
- 1,25-Dihydroxyvitamin D
- 1,25-(OH)2-D
- 1,25-Dihydroxycholecalciferol
- Vit D 1,25
- LAB536-VML
- LAB536VML

Ordering Recommendations:
May be useful for evaluating calcium metabolism in individuals with hypercalcemia or renal failure in addition to Vitamin D, 25-Hydroxy testing. Test is not appropriate for diagnosing vitamin D deficiency or insufficiency.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
19.9-79.3 pg/mL

Interpretive Data:
This test is primarily indicated during patient evaluation for hypercalcemia and renal failure. A normal result does not rule out Vitamin D deficiency. The recommended test for diagnosing Vitamin D deficiency is Vitamin D 25-hydroxy.

Methodology:
Quantitative Chemiluminescent Immunoassay

Vitamin E, Serum or Plasma

LAB130

ORDERING INFO

Collect:
Green (sodium or lithium heparin) or serum separator tube. Also acceptable: Lavender (EDTA) or pink (K_2EDTA).

Synonyms:

- E, Vitamin
- Gamma-Tocopherol
- Tocopherol
- Alpha-Tocopherol
- LAB130-VML
- LAB130VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should fast for 12 hours and abstain from alcohol for 24 hours prior to collection.

Collect:
Green (sodium or lithium heparin) or serum separator tube. Also acceptable: Lavender (EDTA) or pink (K_2EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 1 hour of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.2 mL) Avoid hemolysis.

Unacceptable Conditions:
Whole blood or body fluids other than serum or plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 month; Frozen at -20°C: 1 year

Performed:
Sun-Sat

ORDERING

Vitamin K_1, Serum

LAB1110

ORDERING INFO

Collect:
Plain red or serum separator tube. Also acceptable: Lavender (EDTA) or pink (K2EDTA).

Synonyms:

- K1, Vitamin
- Phylloquinone
- phytonadione
- LAB1110-VML
- LAB1110VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should fast overnight for 12 hours and should not consume alcohol for 24 hours prior to blood draw.

Collect:
Plain red or serum separator tube. Also acceptable: Lavender (EDTA) or pink (K2EDTA).

Specimen Preparation:
Protect from light during collection, storage, and shipment. Separate serum or plasma from cells within 1 hour of collection. Transfer 1 mL serum or plasma to an ARUP Amber Transport Tube. (Min: 0.6 mL)

Unacceptable Conditions:
Any specimen other than serum or EDTA plasma. Hemolyzed specimens.

Storage/Transport Temperature:
Frozen. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 1 month; Frozen: 6 months

Performed:
Sun-Fri

ORDERING

Synonyms:

Volatile Screen, plasma

LAB3474

ORDERING INFO

Collect:
Dark green tube (Sodium Heparin)

Synonyms:

- LAB3474, VSS, Alcohols
- LAB3474-VML
- LAB3474VML

Turn Around Time:
6 hours after sample received in lab

SPECIMEN REQUIREMENTS

Patient Preparation:
A non-alcohol based cleanser should be used to clean the venipuncture site prior to collection.

Collect:
Dark green tube (Sodium Heparin)

Specimen Preparation:
Specimens should be delivered to the lab immediately and should be centrifuged and separated within 2 hours of collection. (Minimum 0.5 mL plasma)

Pediatric Collection:
Dark green microtainer (Sodium heparin)

Storage/Transport Temperature:
Refrigerated (2-8°C) if not delivered to the lab immediately

Performed:
Daily

Stability:
After separation from cells: Refrigerated (2-8°C): 7 days

Specimen:
Plasma

Alternate Specimen:
Gray tube (Sodium fluoride) or red tube (no gel)

ORDERING

Ordering Indicators:
This test is used as an initial screen to check for the presence of acetone, methanol, isopropanol, and/or ethanol in the patient.

Voltage-Gated Potassium Channel (VGKC) Antibody, Serum

LAB3858

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- VGKC Ab
- VGKC complex
- VGKC screen
- LAB3858-VML
- LAB3858VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Separate serum from cells within 1 hour. Transfer 4 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Grossly lipemic or icteric specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Tue

ORDERING

Synonyms:

- VGKC Ab
- VGKC complex
- VGKC screen
- LAB3858-VML
- LAB3858VML

Ordering Recommendations:
Screening test for voltage-gated potassium channel (VGKC) antibody receptor complex-associated autoantibodies. Assay does not identify contactin associated protein 2 (CASPR2) antibody or leucine-rich glioma inactivated 1 protein (LGI1) antibodies. Use to manage antibody-positive (VGKC, LGI1, or CASPR2) individual following immunotherapy and/or plasmapheresis.

Performed:
Tue

Methodology:
Quantitative Radioimmunoassay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Voltage-Gated Potassium Channel Ab, Ser	31 pmol/L or less

Interpretive Data:

Voltage-Gated Potassium Channel (VGKC) antibodies are associated with neuromuscular weakness as found in neuromyotonia (also known as Issacs syndrome) and Morvan syndrome. VGKC antibodies are also associated with paraneoplastic neurological syndromes and limbic encephalitis; however, VGKC antibody-associated limbic encephalitis may be associated with antibodies to leucine-rich, glioma-inactivated 1 protein (LGI1) or contactin-associated protein-2 (CASPR2) instead of potassium channel antigens. A substantial number of VGKC-antibody positive cases are negative for LGI1 and CASPR2 IgG autoantibodies, not all VGKC complex antigens are known. The clinical significance of this test can only be determined in conjunction with the patient's clinical history and related laboratory testing.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Voltage-Gated Potassium Channel Ab, Ser	31 pmol/L or less: Negative 32-87 pmol/L: Indeterminate 88pmol/L or greater: Positive

1-8 days

Ordering Recommendations:

Screening test for voltage-gated potassium channel (VGKC) antibody receptor complex-associated autoantibodies. Assay does not identify contactin associated protein 2 (CASPR2) antibody or leucine-rich glioma inactivated 1 protein (LGI1) antibodies. Use to manage antibody-positive (VGKC, LGI1, or CASPR2) individual following immunotherapy and/or plasmapheresis.

Interpretive Data:

Voltage-Gated Potassium Channel (VGKC) antibodies are associated with neuromuscular weakness as found in neuromyotonia (also known as Issacs syndrome) and Morvan syndrome. VGKC antibodies are also associated with paraneoplastic neurological syndromes and limbic encephalitis; however, VGKC antibody-associated limbic encephalitis may be associated with antibodies to leucine-rich, glioma-inactivated 1 protein (LGI1) or contactin-associated protein-2 (CASPR2) instead of potassium channel antigens. A substantial number of VGKC-antibody positive cases are negative for LGI1 and CASPR2 IgG autoantibodies, not all VGKC complex antigens are known. The clinical significance of this test can only be determined in conjunction with the patient's clinical history and related laboratory testing.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Voltage-Gated Potassium Channel Ab, Ser	31 pmol/L or less: Negative 32-87 pmol/L: Indeterminate 88pmol/L or greater: Positive

von Willebrand Factor Activity (Ristocetin Cofactor)

LAB335

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB335, Von Willebrand Factor Activity, RCC
- LAB335-VML
- LAB335VML

Turn Around Time:

2 - 7 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Twice per week - variable days

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Methodology:
Ristocetin induced agglutination of formalin fixed platelets

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
45 - 140% Normal range is influenced by ABO blood type.

Interpretive Data:
The ristocetin cofactor activity may be higher than physiologic baseline in several situations such as pregnancy, replacement therapy with factor VIII concentrates (Humate P), administration of 1-deamino (8-d-arginine)-vasopressin (DDAVP), physiologic stress, or inflamation. Clinical correlation is advised.

Methodology:
Ristocetin induced agglutination of formalin fixed platelets

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
The ristocetin cofactor activity may fail to reflect von Willebrand disease in serveral situations such as pregnanacy, factor replacement therapy, stress, or inflamation.

Components:
N/A

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

VWF multimers should not be ordered in isolation unless a previous assessment has demonstrated concern for a congenital or acquired defect in VWF. Typically multimers are obtained when the VWF activity-to-antigen ratio is < 0.7 or if acquired VWD is suspected.

Synonyms:

- LAB1111, VWM, von Willebrand Multimer Analysis, Coagulation Interpretation, von Willebrand panel
- LAB1111-VML
- LAB1111VML

Performed:
Once per week- variable days.

Turn Around Time:
7 - 14 days

Methodology:
Electrophoresis

Components:
von Willebrand Multimers, Coagualtion Interpretation

RESULTS INTERPRETATION

Reference Interval:
Normal multimer distribution.

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Electrophoresis

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
A factor VIII activity, vWF antigen, and Ristocetin Cofactor assay will be performed prior to the vWF multimer analysis. There will be a separate change for the factor VIII activity, vWF antigen, and Ristocetin Cofactor assays.

Components:
von Willebrand Multimers, Coagualtion Interpretation

von Willebrand Factor Panel

LAB1112

ORDERING INFO

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Synonyms:

- LAB1112, VWP, von WIllebrand workup, Von Willebrand Panel
- LAB1112-VML
- LAB1112VML

Turn Around Time:

1-3 days, 7-14 days if the VWF Multimer is required.

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: Two 2.7 mL Light blue tubes (3.2% Sodium Citrate); Neonatal: Two 1.8mL Light blue tubes (3.2% Sodium Citrate)

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Factor VIII activity, vWF antigen -Monday - Sunday; Ristocetin Cofactor twice weekly - variable days, vWF multimers, once weekly - variable days

Stability:

Ambient (15-25°C): 4 hours; Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:
None

ORDERING

Ordering Indicators:
The von Willebrand factor panel should be ordered for diagnostic testing for von Willebrand disease or monitoring of disease. As the activity assay is not reported dialy, post-operative monitoring should be managed with VWF:antigen and factor VIII activity orders separately.

Synonyms:

- LAB1112, VWP, von WIllebrand workup, Von Willebrand Panel

Voriconazole, Quantitation by LC-MS/MS

LAB3859

ORDERING INFO

Collect:
Plain Red, Lavender (EDTA), or Green (Sodium or Lithium Heparin).

Synonyms:

- Vfend
- Vfend blood concentration
- voriconazole blood concentration
- LAB3859-VML
- LAB3859VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Specimens collected just before or within 15 minutes of the next dose represent the TROUGH levels. Specimens obtained within 15-30 minutes after the end of I.V. infusion or 45-60 minutes after an IM injection or 90 minutes after oral intake represent the PEAK level. Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain Red, Lavender (EDTA), or Green (Sodium or Lithium Heparin).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.6 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, Light Blue (citrate), or Yellow (SPS or ACD solution).

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 48 hours; Frozen: 6 months

Performed:
Tue-Sat

ORDERING

Synonyms:

- Vfend
- Vfend blood concentration
- voriconazole blood concentration
- LAB3859-VML
- LAB3859VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Tue-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:
Effective February 19, 2013

Therapeutic Range (trough)	1.0-6.0 µg/mL
Toxic Level	Greater than 6.0 µg/mL

Interpretive Data:
Voriconazole is an azole antifungal drug indicated to treat invasive aspergillosis, candidiasis, scedosporiosis, and fusariosis infections. The therapeutic range is based on serum, predose (trough) draw collection at steady-state concentration. The pharmacokinetics of voriconazole are influenced by drug-drug interactions when coadministered with drugs metabolized by cytochrome P450 2C9, 2C19 and 3A4 enzymes. Adverse effects may include nausea, vomiting, tachycardia, and elevated serum liver enzymes.

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

West Nile Virus Antibodies, IgG and IgM by ELISA, CSF

LAB208

ORDERING INFO

Collect:
CSF.

Synonyms:

- WNV CSF antibodies
- WNV CSF
- WNV IgG and IgM CSF
- Arbovirus
- Flavivirus
- LAB208-VML
- LAB208VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 2 mL CSF to an ARUP Standard Transport Tube. (Min: 0.3 mL)
New York State Clients: 2 mL (Min: 0.7 mL)

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, or xanthochromic specimens.

Storage/Transport Temperature:
Refrigerated.
New York State Clients: Frozen

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)
New York State Clients: Ambient: 4 days; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun, Tue, Fri

ORDERING

Synonyms:

- Arbovirus
- Flavivirus
- LAB208-VML
- LAB208VML

Ordering Recommendations:
Preferred test is West Nile Virus Antibody, IgM by ELISA, CSF (0050239).

Performed:
Sun, Tue, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
West Nile Virus Antibody IgG CSF	1.29 IV or less
West Nile Virus Antibody IgM CSF	0.89 IV or less

Interpretive Data:

This test is intended to be used as a semi-quantitative means of detecting West Nile virus-specific IgG and IgM in CSF specimens in which there is a clinical suspicion of West Nile virus infection. This test should not be used solely for quantitative purposes, nor should the results be used without correlation to clinical history or other data. Because other members of the Flaviviridae family, such as St. Louis encephalitis virus, show extensive cross-reactivity with West Nile virus, serologic testing specific for these species should be considered.

The detection of antibodies to West Nile virus in cerebrospinal fluid may indicate central nervous system infection. However, consideration must be given to possible contamination by blood or transfer of serum antibodies across the blood-brain barrier.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component Result	Interpretation
West Nile Virus Antibody, IgG by ELISA, CSF	1.29 IV or less: Negative - No significant level of West Nile virus IgG antibody detected. 1.30-1.49 IV: Equivocal - Questionable presence of West Nile virus IgG antibody detected. Repeat testing in 10-14 days may be helpful 1.50 IV or greater: Positive - Presence of IgG antibody to West Nile virus detected, suggestive of current or past infection.
West Nile Virus Antibody, IgM by ELISA, CSF	0.89 IV or less: Negative - No significant level of West Nile virus IgM antibody detected. 0.90-1.10 IV: Equivocal - Questionable presence of West Nile virus IgM antibody detected. Repeat testing in 10-14 days may be helpful. 1.11 IV or greater: Positive - Presence of IgM antibody to West Nile virus detected, suggestive of current or recent infection.

West Nile Virus Antibody, IgM by ELISA, Serum

LAB1269

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Flavivirus
- Arbovirus
- WNV IgM
- LAB1269-VML
- LAB1269VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun, Tue, Fri

ORDERING

Synonyms:

- Flavivirus
- Arbovirus
- WNV IgM
- LAB1269-VML
- LAB1269VML

Ordering Recommendations:
May aid in the diagnosis of acute West Nile infection.

Performed:
Sun, Tue, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:
0.89 IV or less: Negative - No significant level of West Nile virus IgM antibody detected.
0.90-1.10 IV: Equivocal - Questionable presence of West Nile virus IgM antibody detected. Repeat testing in 10-14 days may be helpful.
1.11 IV or greater: Positive - Presence of IgM antibody to West Nile virus detected, suggestive of current or recent infection.

Interpretive Data:

This test is intended to be used as a semi-quantitative means of detecting West Nile virus-specific IgM in serum specimens in which there is a clinical suspicion of West Nile virus infection. This test should not be used solely for quantitative purposes, nor should the results be used without correlation to clinical history or other data. Because other members of the Flaviviridae family, such as St. Louis encephalitis virus, show extensive cross-reactivity with West Nile virus, serologic testing specific for these species should be considered.

Seroconversion between acute and convalescent sera is considered strong evidence of current or recent infection. The best evidence for infection is a significant change on two appropriately timed specimens, where both tests are done in the same laboratory at the same time.

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay

White Blood Cell Count

LAB299

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- WC, White Blood Cell Quantitative, WBC
- LAB299-VML
- LAB299VML

Turn Around Time:
STAT 1 hour; Routine 2 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Collect to fill line on tube, gently invert back and forth immediately for blood to mix with EDTA anitcoagulant to prevent clotting. Do not draw above IV line. (Min 1.0 mL)

Pediatric Collection:
Pediatric: 160 microliters minimum

Storage/Transport Temperature:
Refrigerated preferred, or ambiant temperature, DO NOT FREEZE

Performed:
Daily

Stability:
Room temperature: 8 hrs, 2 to 8 degrees C: 24 hrs

Specimen:
Whole Blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Infection, leukemias, leukopenias

Whole Exome Sequencing NGS Testing, Blood Saliva DNA

ORDERING INFO

Collect:
Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Synonyms:

- WES, Whole Exome, Next Generation Sequencing

Turn Around Time:
90 Business Days From Financial Clearance

SPECIMEN REQUIREMENTS

Patient Preparation:
Saliva: Patient Must Follow Kit Instructions

Collect:
Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Specimen Preparation:
Extracted DNA should be sent in a screw cap tube with at least 2 micrograms - 5 micrograms of purified DNA at a concentration of at least 20 ng/ul - 50 ng/uL. Indicate patient's name, date of birth, and concentration on tube label. (Minimum Volume: 2 micrograms for limited specimens)

Storage/Transport Temperature:
Blood: Ambient (15-25°C), Saliva: Ambient (15-25°C), DNA Ambient (15-25°C)

Performed:
Weekly

Stability:
Blood Ambient (15-25°C): 72 Hours, Saliva Ambient (15-25°C): 2 weeks, DNA Ambient (15-25°C): 48 Hours

Specimen:
N/A

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Preferred test to determine genetic causes for individuals with nonspecific or unusual disease presentations and a genetic condition is suspected.

Synonyms:

- WES, Whole Exome, Next Generation Sequencing

Zinc Protoporphyrin (ZPP), Whole Blood

LAB1085

ORDERING INFO

Collect:
Lavender (EDTA), Royal blue (K2EDTA), Royal blue (NaHep),tan (K2EDTA), or pink (K2EDTA).

Synonyms:

- ZP
- ZPP
- ZPP/Heme Ratio
- Porphyrins
- LAB1085-VML
- LAB1085VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), Royal blue (K2EDTA), Royal blue (NaHep),tan (K2EDTA), or pink (K2EDTA).

Specimen Preparation:
Transport 1 mL whole blood. (Min: 0.2 mL)

Unacceptable Conditions:
Clotted, frozen, or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 30 hours; Refrigerated: 5 weeks; Frozen: Unacceptable

Performed:
Mon-Fri

ORDERING

Synonyms:

- ZP
- ZPP
- ZPP/Heme Ratio
- Porphyrins
- LAB1085-VML
- LAB1085VML

Ordering Recommendations:
This test should not be used as the primary screening test for lead exposure; the preferred test for lead exposure assessment is Lead Blood (Venous) (0020098). For iron deficiency assessment, Iron and Iron Binding Capacity (0020420) and Ferritin (0070065) are recommended. For assessment of occupational exposure to lead, Lead Industrial Exposure Panel, Adults (0025016) is recommended.

Performed:
Mon-Fri

Methodology:
Quantitative Hematofluorometry

Reported:
1-4 days

Notes:
Elevated ZPP results are seen in early and late iron deficiency, the anemia of chronic disease, chronic lead poisoning, and erythropoietic protoporphyria. Elevated bilirubin or riboflavin and hemolyzed, clotted, or improperly aliquoted specimens may falsely increase the ZPP concentration.

A more specific test for free protoporphyrin is Porphyrins, Serum Total (0080429). Erythrocyte Porphyrin (EP), Whole Blood (0020610), measures free protoporphyrin and zinc protoporphyrin.

RESULTS INTERPRETATION

Reference Interval:
0-69 µmol ZPP/ mol Hem

Interpretive Data:

This test was performed on the ProtoFluor Z system manufactured by Helena Laboratories. The result is not comparable to results obtained from extraction-based methods or from the AVIV ZPP system.

The test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the U.S. Food and Drug Administration. This test was performed in a CLIA-certified laboratory and is intended for clinical purposes.

Methodology:

Zinc, Serum or Plasma

LAB581

ORDERING INFO

Collect:
Royal blue (No Additive), Royal blue (K2EDTA), or Royal blue (NaHep).

Synonyms:

- serum zinc level
- ZNS
- Zn
- LAB581-VML
- LAB581VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Upon the advice of their physician, patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and nonessential over-the-counter medications for one week prior to sample draw.

Collect:
Royal blue (No Additive), Royal blue (K2EDTA), or Royal blue (NaHep).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection Transfer 2 mL serum or plasma to an ARUP Trace Element-Free Transport Tube (ARUP supply #43116) available online through eSupply using ARUP Connect or contact ARUP Client Services at (800) 522-2787. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens that are not separated from the red cells or clot within 2 hours. Specimens collected in containers other than specified. Specimens transported in containers other than specified. Hemolyzed specimens.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated or frozen.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Indefinitely

Performed:
Sun-Sat

ORDERING

Synonyms:

- serum zinc level
- ZNS
- Zn
- LAB581-VML
- LAB581VML

Ordering Recommendations:
May be useful as an indicator of acute deficiency. For acute toxicity, Zinc, Urine (0020462) may be a more reliable indicator of exposure.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
60.0-120.0 µg/dL

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of serum/plasma zinc, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Circulating zinc concentrations are dependent on albumin status and are depressed with malnutrition. Zinc may also be lowered with infection, inflammation, stress, oral contraceptives, and pregnancy. Zinc may be elevated with zinc supplementation or fasting. Elevated zinc concentrations may interfere with copper absorption.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

<tr><td>51-80 years</td><td>800-2100</td><td>500-1400</td></tr>
<tr><td>81 years and older</td><td>600-2000</td><td>400-1300</td></tr>
</table>
</td></tr>
<tr><td>Zinc, Urine - ratio to CRT</td><td>110.0-750.0 µg/g CRT</td></tr>
</table>

Interpretive Data:
Zinc is predominantly eliminated in the feces. Elevated urine zinc may suggest excessive zinc supplementation but should be interpreted with a corresponding serum zinc concentration.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

ADDITIONAL INFORMATION

CPT Codes:
84630

Section:
RF-ARUP

Remarks:
Record total volume and collection time interval on transport tube and on test request form.

Notes:
High concentrations of iodine or gadolinium may interfere with elemental testing.

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:
24 Hour Urine. Refrigerate during collection. Specimen must be collected in a plastic container. Also acceptable: Random Urine.24 Hour Urine. Refrigerate during collection. Specimen must be collected in a plastic container. Also acceptable: Random Urine.

Specimen Preparation:
Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL)

Patient Preparation:

Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician). Collection from patients receiving iodinated or gadolinium-based contrast media must be avoided for a minimum of 72 hours post-exposure. Collection from patients with impaired kidney function should be avoided for a minimum of 14 days post contrast media exposure.

Unacceptable Conditions:

Specimens collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Acid preserved urine. Specimens transported in containers other than specified. Specimen contaminated with blood or fecal material.

Stability (from collection to initiation):

Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated. Also acceptable: Room temperature or frozen.

Synonyms:

- Normalized Urine Zinc
- Zn
- Zn Urine
- urine zinc concentration
- Zinc/Creatinine Ratio, Random, Urine
- ZNU
- LAB3242-VML
- LAB3242VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-5 days

Ordering Recommendations:

Useful as an indicator of acute toxicity. May be useful as an indicator of deficiency in conjunction with Zinc, Serum or Plasma (0020097).

Interpretive Data:

Zinc is predominantly eliminated in the feces. Elevated urine zinc may suggest excessive zinc supplementation but should be interpreted with a corresponding serum zinc concentration.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Zonisamide

LAB6069

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2 EDTA).

Synonyms:

- Excegran
- Zonegran
- zonegran blood level
- zonisamide blood concentration
- zonegran concentration
- LAB6069-VML
- LAB6069VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Pre-dose (trough) draw - At steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K_2 or K_3EDTA) or pink (K_2 EDTA).

Specimen Preparation:
Separate serum or plasma from cells within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution).

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 1 week; Frozen: 6 weeks

Performed:
Sun-Sat

ORDERING

- Excegran
- Zonegran
- zonegran blood level
- zonisamide blood concentration
- zonegran concentration
- LAB6069-VML
- LAB6069VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme Multiplied Immunoassay Technique

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Effective February 19, 2013

Therapeutic Range	Not well established
Toxic Level	Greater than 80 µg/mL

Interpretive Data:
The proposed therapeutic range for seizure control is 10-40 µg/mL. Toxic concentrations may cause coma, seizures and cardiac abnormalities. Pharmacokinetics varies widely, particularly with co-medications and/or compromised renal function.

Methodology:
Quantitative Enzyme Multiplied Immunoassay Technique
