Aspergillus Antibodies by Complement Fixation

LAB3697

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Aspergillosis
- LAB3697-VML
- LAB3697VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Aspergillosis
- LAB3697-VML
- LAB3697VML

Ordering Recommendations:
Aids in the diagnosis of allergic bronchopulmonary aspergillosis (ABPA) and aspergilloma. For more complete serologic testing, immunodiffusion should be performed in parallel with complement fixation; refer to Aspergillus Antibodies by Complement Fixation and Immunodiffusion (0050101). For diagnosis of invasive aspergillosis, consider ordering Aspergillus Galactomannan Antigen by EIA, Serum (0060068) or Aspergillus Galactomannan Antigen by EIA, Bronchoscopy (2003150).

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Complement Fixation

Reported:
2-5 days

RESULTS INTERPRETATION

Reference Interval:
Less than 1:8

Interpretive Data:
A titer of 1:8 or greater suggests Aspergillus infection or allergy. Cross-reactions with dimorphic fungi are not unusual within the genus Aspergillus.

Methodology:
Semi-Quantitative Complement Fixation

ADDITIONAL INFORMATION

CPT Codes:
86606

Section:
RF-ARUP

Aspergillus Antibodies by Immunodiffusion

LAB3698

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Aspergillosis
- Aspergillus fumigatus
- Aspergillus flavus
- Aspergillus niger
- Aspergillus terreus
- Precipitin, mycelial-phase
- LAB3698-VML
- LAB3698VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum an ARUP Standard Transport Tube. (Min: 0.15 mL) Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Babesia microti Antibodies, IgG and IgM by IFA

LAB1257

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- B microti Ab
- B microti Ab panel
- Babesia microti Antibodies (IgG, IgM)
- Babesia Microti IgG/IgM Ab Panel
- Babesiosis Serology
- LAB1257-VML
- LAB1257VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred, and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Bacterially contaminated, hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon, Wed, Sat

ORDERING

Synonyms:

- B microti Ab
- B microti Ab panel
- Babesia microti Antibodies (IgG, IgM)
- Babesia Microti IgG/IgM Ab Panel
- Babesiosis Serology
- LAB1257-VML
- LAB1257VML

Ordering Recommendations:
Useful if Giemsa stain is negative but high suspicion of babesiosis exists. Will not detect B. duncani or strain MO-1.

Performed:
Mon, Wed, Sat

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Babesia microti IgG	Less than 1:16
Babesia microti IgM	Less than 1:20

Interpretive Data:

Component	Interpretation
Babesia microti Antibody, IgG by IFA	< 1:16 Negative - No significant level of detectable Babesia IgG antibody. 1:16 Equivocal - Repeat testing in 10-14 days may be helpful. > 1:16 Positive - IgG antibody to Babesia detected, which may indicate a current or past infection.
Babesia microti Antibody, IgM by IFA	< 1:20 Negative - No significant level of detectable Babesia IgM antibody. 1:20 Equivocal - Repeat testing in 10-14 days may be helpful. > 1:20 Positive - IgM antibody to Babesia detected, which may indicate a current or recent infection.

Bartonella Species by PCR

LAB1321

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA) or serum separator tube. Also acceptable: CSF or tissue.

Synonyms:

- Bartonella henselae
- Bartonella PCR
- Bartonella, Molecular Detection
- Cat Scratch Disease
- LAB1321-VML
- LAB1321VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA) or serum separator tube. Also acceptable: CSF or tissue.

Specimen Preparation:
Separate serum or plasma from cells. Transfer 1 mL serum, plasma, whole blood, or CSF to a sterile container. (Min: 0.5 mL). Tissue: Transfer to a sterile container and freeze immediately. Also acceptable: Formalin-fixed paraffin-embedded (FFPE) tissue.

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Whole blood: Refrigerated. FFPE: Room temperature. All others: Frozen.

Stability (from collection to initiation):
Whole Blood: Ambient: 7 days; Refrigerated: 7 days: Frozen: 7 days.
Tissue: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 month.
FFPE: Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable.
All Others: Ambient: 24 hours; Refrigerated: 5 days; Frozen: 1 month.

Performed:
Tue, Fri

Remarks:
Specimen source required.

ORDERING

Synonyms:

- Bartonella henselae
- Bartonella PCR
- Bartonella, Molecular Detection
- Cat Scratch Disease
- LAB1321-VML
- LAB1321VML

Ordering Recommendations:
Detect Bartonella species in blood, CSF, or tissue.

Performed:
Tue, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-5 days

RESULTS INTERPRETATION

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Qualitative Polymerase Chain Reaction

Mon, Thu

ORDERING

Synonyms:

- B henselae IgG
- B henselae IgM
- Bartonella henselae Abs
- Cat Scratch Disease Ab Panel, Serum
- LAB785-VML
- LAB785VML

Ordering Recommendations:
May assist in diagnosing cat scratch disease in patient with typical signs and symptoms and a compatible exposure history.

Performed:
Mon, Thu

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-8 days

RESULTS INTERPRETATION

Interpretive Data:
Refer to individual components.

Component Result	Interpretation
Bartonella henselae Antibody, IgG by IFA	<1:64 Negative - No significant level of Bartonella henselae IgG antibody detected. 1:64-1:128 Equivocal - Questionable presence of Bartonella henselae IgG antibody detected. Repeat testing in 10-14 days may be helpful. >=1:256 Positive - Presence of IgG antibody to Bartonella henselae detected, suggestive of current or past infection.
Bartonella henselae Antibody, IgM by IFA	< 1:16 Negative - No significant level of Bartonella henselae IgM antibody detected. >= 1:16 Positive - Presence of IgM antibody to Bartonella henselae detected, suggestive of current or recent infection.

Blastomyces dermatitidis Antibodies by Immunoassay with Reflex to Immunodiffusion, Serum

LAB5992

ORDERING INFO

Collect:
Serum Separator Tube.

Synonyms:

- Blastomyces dermatitidis, yeast-phase
- Blastomycoses
- LAB5992-VML
- LAB5992VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Blastomyces dermatitidis, yeast-phase
- Blastomycoses
- LAB5992-VML
- LAB5992VML

Ordering Recommendations:
Use to detect Blastomyces antibodies in serum. For diagnosis of blastomycosis, consider testing in conjunction with histology or culture.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay/Immunodiffusion

Reported:
2-6 days

Notes:
This immunoassay detects total antibodies against yeast-phase antigens from Blastomyces dermatitidis.
If Blastomyces antibodies are equivocal or positive by immunoassay then Blastomyces dermatitidis Antibodies by Immunodiffusion will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Blastomyces Antibodies EIA, SER	0.9 IV or less

Interpretive Data:

Component	Interpretation
Blastomyces Antibody by EIA, SER	0.9 IV or less Negative 1.0-1.4 IV Equivocal 1.5 IV or greater Positive

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay/Immunodiffusion

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- Blastomyces dermatitidis, yeast-phase
- Blastomycoses
- LAB5992-VML
- LAB5992VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
2-6 days

Ordering Recommendations:
Use to detect Blastomyces antibodies in serum. For diagnosis of blastomycosis, consider testing in conjunction with histology or culture.

Interpretive Data:

Component	Interpretation
Blastomyces Antibody by EIA, SER	0.9 IV or less Negative 1.0-1.4 IV Equivocal 1.5 IV or greater Positive

Reference Interval:

Components	Reference Interval
Blastomyces Antibodies EIA, SER	0.9 IV or less

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay/Immunodiffusion

Section:
RF-ARUP

CPT Codes:
86612; if reflexed, add 86612

Notes:
This immunoassay detects total antibodies against yeast-phase antigens from Blastomyces dermatitidis.
If Blastomyces antibodies are equivocal or positive by immunoassay then Blastomyces dermatitidis Antibodies by Immunodiffusion will be added. Additional charges apply.

Bordetella pertussis Antibodies, IgA, IgG, and IgM by ELISA with Reflex to Immunoblot

LAB3706

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- B. pertussis Abs panel reflex
- Pertussis Abs (IgA, IgG, IgM) reflex to immunoblot
- Pertussis Antibody
- LAB3706-VML
- LAB3706VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL) Parallel testing is preferred, and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year
New York State Clients: Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Tue, Fri

Remarks:
New York State Clients: There are no NY approved tests available for the IgM component of this assay. NYSDOH will not approve NPL requests for IgM.

ORDERING

Synonyms:

- B. pertussis Abs panel reflex
- Pertussis Abs (IgA, IgG, IgM) reflex to immunoblot
- Pertussis Antibody
- LAB3706-VML
- LAB3706VML

Ordering Recommendations:
If serology is used to assess late-stage pertussis (>4 weeks), the recommended test is Bordetella pertussis Antibodies, IgA and IgG by ELISA with Reflex to Immunoblot (2001774). CDC-recommended first-line tests for pertussis are Bordetella pertussis/parapertussis by PCR (0065080) and/or Bordetella pertussis Culture (0060117).

Performed:
Tue, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay/Qualitative Immunoblot

Reported:
1-5 days

Notes:
If Bordetella pertussis Antibody, IgA by ELISA is 1.2 IV or greater, then Bordetella pertussis IgA Immunoblot testing will be added; if Bordetella pertussis Antibody, IgG by ELISA is 1.05 IV or greater, then Bordetella pertussis IgG Immunoblot testing will be added; If Bordetella pertussis Antibody, IgM by ELISA is 1.2 IV or greater, then Bordetella pertussis IgM Immunoblot testing will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
B. pertussis Ab, IgA by ELISA	1.1 IV or less
B. pertussis Ab, IgG by ELISA	1.04 IV or less
B. pertussis Ab, IgM by ELISA	1.1 IV or less

Interpretive Data:

Recommend that treatment decisions be based on the result of the B. pertussis IgM immunoblot test instead of the ELISA test. B. pertussis IgM test by ELISA may produce false-positive results.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Bordetella pertussis Antibody, IgA by ELISA	0.9 IV or less: Negative - No significant level of detectable Bordetella pertussis IgA antibody. 1.0-1.1 IV: Equivocal - Repeat testing in 10-14 days may be helpful. 1.2 IV or greater: Positive - IgA antibody to Bordetella pertussis detected, which may indicate a current or past exposure/immunization to B. pertussis.
Bordetella pertussis Antibody IgG by ELISA	0.94 IV or less: Negative - No significant level of detectable B. pertussis IgG antibody. 0.95-1.04 IV: Equivocal - Repeat testing in 10-14 days may be helpful. 1.05 IV or greater: Positive - IgG antibody to B. pertussis detected, which may indicate a current or recent exposure/immunization to B. pertussis.
Bordetella pertussis Antibody IgM by ELISA	0.9 IV or less: Negative - No significant level of detectable B. pertussis IgM antibody. 1.0-1.1 IV: Equivocal - Repeat testing in 10-14 days may be helpful. 1.2 IV or greater: Positive - IgM antibody to B. pertussis detected, which may indicate a current or recent exposure/immunization to B. pertussis

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay/Qualitative Immunoblot

ADDITIONAL INFORMATION

CPT Codes:

86615 x3; if reflexed, add 86615 for each Immunoblot

Section:

RF-ARUP

Remarks:

New York State Clients: There are no NY approved tests available for the IgM component of this assay. NYSDOH will not approve NPL requests for IgM.

Notes:

If Bordetella pertussis Antibody, IgA by ELISA is 1.2 IV or greater, then Bordetella pertussis IgA Immunoblot testing will be added; if Bordetella pertussis Antibody, IgG by ELISA is 1.05 IV or greater, then Bordetella pertussis IgG Immunoblot testing will be added; If Bordetella pertussis Antibody, IgM by ELISA is 1.2 IV or greater, then Bordetella pertussis IgM Immunoblot testing will be added. Additional charges apply.

Bordetella pertussis/*parapertussis* by PCR

LAB3155

ORDERING INFO

Collect:
Respiratory specimen: Aspirate, bronchoalveolar lavage (BAL) or swab.

Synonyms:

- Bordetella pertussis and parapertussis
- Bordetella Pertussis, parapertussis Molecular Detection
- Whooping Cough
- LAB3155-VML
- LAB3155VML

SPECIMEN REQUIREMENTS

Collect:
Respiratory specimen: Aspirate, bronchoalveolar lavage (BAL) or swab.

Specimen Preparation:
Fluid: Transfer 2 mL respiratory specimen to a sterile container. (Min: 0.5 mL) Also acceptable: Transfer to viral transport media (ARUP supply #12884). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787
Swabs: Place in viral transport media.

Unacceptable Conditions:
Calcium-alginate swabs.

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 5 days; Frozen: 2 weeks.

Performed:
Sun-Sat

Remarks:
Specimen source required.

ORDERING

Borrelia Species by PCR (Lyme Disease)

LAB1205

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA) or serum separator tube. OR CSF, synovial fluid or tissue.

Synonyms:

- Lyme Disease PCR
- B. burgdorferi DNA detection
- Borrelia burgdorferi
- Lyme Disease
- Tick Borne Disease
- LAB1205-VML
- LAB1205VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA) or serum separator tube. OR CSF, synovial fluid or tissue.

Specimen Preparation:
Separate serum or plasma from cells. Transfer 1 mL serum, plasma, CSF or synovial fluid to a sterile container. (Min: 0.5 mL). Tissue: Transfer to a sterile container and freeze immediately.

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Tissue: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 year
All Others: Ambient: 8 hours; Refrigerated: 72 hours; Frozen: 1 year

Performed:
Mon, Wed, Fri

Remarks:
Specimen source required.

ORDERING

Synonyms:

- Lyme Disease PCR
- B. burgdorferi DNA detection
- Borrelia burgdorferi
- Lyme Disease
- Tick Borne Disease
- LAB1205-VML
- LAB1205VML

Ordering Recommendations:
Not a first-line test for Lyme disease. May be useful if strong suspicion of Lyme disease persists in spite of persistent negative serologic testing. Blood and CSF specimens have poor clinical sensitivity for detection of Borrelia burgdorferi by PCR.

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-4 days

RESULTS INTERPRETATION

- Lyme Antibodies
- Lyme Disease
- Lyme Disease Ab Western Blot
- Lyme Disease Antibodies (Serum), WB
- Lyme Disease antibodies WB
- LAB5769-VML
- LAB5769VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Unacceptable Conditions:
CSF or plasma. Contaminated, heat-inactivated, severely hemolyzed, severely lipemic, and severely icteric specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Lyme Antibodies
- Lyme Disease
- Lyme Disease Ab Western Blot
- Lyme Disease Antibodies (Serum), WB
- Lyme Disease antibodies WB
- LAB5769-VML
- LAB5769VML

Ordering Recommendations:
Do not order in the absence of a positive or equivocal first-tier screening test for Lyme disease. Second-tier testing for use <=4 weeks after symptom onset.

Performed:
Sun-Sat

Methodology:
Qualitative Immunoblot

Reported:
1-4 days

Notes:
Per CDC guidelines, if ELISA test result is NEGATIVE, immunoblot should not be performed.

This test should be used for confirmation of an equivocal or positive B. burgdorferi total antibodies, IgG and/or IgM test performed on patients less than 4 weeks after appearance of erythema migrans.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
B. burgdorferi IgG Immunoblot	Negative
B. burgdorferi Antibody IgM Immunoblot	Negative

Interpretive Data:

IgG: For this assay, a positive result is reported when any 5 or more of the following 10 bands are present: 18, 23, 28, 30, 39, 41, 45, 58, 66, or 93 kDa. All other banding patterns are reported as negative.

IgM: For this assay, a positive result is reported when any 2 or more of the following bands are present: 23, 39, or 41 kDa. All other banding patterns are reported as negative.

Methodology:

Qualitative Immunoblot

ADDITIONAL INFORMATION

CPT Codes:

86617 x2

Section:

RF-ARUP

Notes:

Per CDC guidelines, if ELISA test result is NEGATIVE, immunoblot should not be performed.

This test should be used for confirmation of an equivocal or positive B. burgdorferi total antibodies, IgG and/or IgM test performed on patients less than 4 weeks after appearance of erythema migrans.

Borrelia burgdorferi VlsE1/pepC10 Antibodies, Total by ELISA With Reflex to IgM and IgG by ELISA (Modified Two-Tier Testing)

LAB6575

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- MTTT
- VlsE lipoprotein, VlsE1/pepC10 assay
- Lyme disease C6 peptide Ab reflex panel, Modified 2-tier testing
- Lyme disease
- Lyme disease VlsE1/pepC10 Total Ab, ELISA reflex to IgM and IgM ELISAs
- LAB6575-VML
- LAB6575VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL)

Unacceptable Conditions:
CSF or plasma. Contaminated, heat-inactivated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Mon-Fri

ORDERING

Synonyms:

- MTTT
- VlsE lipoprotein, VlsE1/pepC10 assay
- Lyme disease C6 peptide Ab reflex panel, Modified 2-tier testing
- Lyme disease
- Lyme disease VlsE1/pepC10 Total Ab, ELISA reflex to IgM and IgM ELISAs
- LAB6575-VML
- LAB6575VML

Ordering Recommendations:
Preferred reflex test to diagnose Lyme disease in symptomatic individuals. Reflex pattern follows the modified two-tier testing (MTTT) approach; a positive or equivocal screen is confirmed by immunoassay.

Performed:
Mon-Fri

Methodology:
Semiquantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-4 days

Notes:
If VlsE1/pepC10 antibodies by ELISA is 0.91 IV or greater, then IgM and IgG by ELISA will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
B. burgdorferi VlsE1/pepC10 Abs, ELISA	0.90 IV or less

Interpretive Data:
Refer to report.

Component	Interpretation
B. Burgdorferi VlsE1/pepC10 Abs, ELISA	0.90 IV or less; Negative - VlsE1 and pepC10 antibodies to B. burgdorferi not detected. 0.91-1.09 IV; Equivocal - Repeat testing in 10-14 days may be helpful. 1.10 IV or greater; Positive - VlsE1 and pepC10 antibodies to B. burgdorferi detected.

Methodology:
Semiquantitative Enzyme-Linked Immunosorbent Assay

ADDITIONAL INFORMATION

CPT Codes:
86618; if reflexed, add 86618 x2

Section:
RF-ARUP

Brucella Antibody (Total) by Agglutination

LAB221

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- Brucella Serology
- Brucella Total Antibody Agglutination, Serum
- Febrile Agglutinins
- LAB221-VML
- LAB221VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens.

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 6 months (avoid repeated freeze/thaw cycles)

Performed:
Mon-Fri

Remarks:
Mark specimens plainly as "acute" or "convalescent."

ORDERING

Synonyms:

- Brucella Serology
- Brucella Total Antibody Agglutination, Serum
- Febrile Agglutinins
- LAB221-VML
- LAB221VML

Ordering Recommendations:
Recommended serology test to detect recent infection from Brucella in the context of a clinically compatible illness and exposure history.

Performed:
Mon-Fri

Methodology:
Semi-Quantitative Agglutination

Reported:
2-4 days

RESULTS INTERPRETATION

Reference Interval:
Less than 1:20 Negative

Interpretive Data:
Cross-reactions may occur between Brucella and F. tularensis antigens and antisera; therefore, parallel tests should be run with these antigens. A fourfold rise in titer is considered diagnostic. A single serum titer of 1:80 or 1:160 is suggestive of brucellosis when accompanied by a compatible clinical course in a patient with a history of potential exposures.

Methodology:
Semi-Quantitative Agglutination

Chlamydia trachomatis Culture

LAB3131

ORDERING INFO

Collect:
Cervical, eye, rectal, urethral swab, or peritoneal fluid. Also acceptable for newborns: Nasopharyngeal aspirate, swab or washing.

Synonyms:

- C. Trachomatis
- Chlamydia Trachomatis
- LAB3131-VML
- LAB3131VML

SPECIMEN REQUIREMENTS

Collect:
Cervical, eye, rectal, urethral swab, or peritoneal fluid. Also acceptable for newborns: Nasopharyngeal aspirate, swab or washing.

Specimen Preparation:
Immediately place swab, fluid, or washing in 3 mL universal transport medium such as M4, M4RT, M5, M6, UniTranz-RT, or UTM (ARUP supply #12884). Available online through eSupply using ARUP Connect or contact ARUP Client Services at (800) 522-2787.

Unacceptable Conditions:
Urine. Specimens in any transport media other than indicated. Calcium alginate, dry, or wood swabs.

Storage/Transport Temperature:
Frozen on dry ice.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: 48 hours; Frozen at -20°C: Unacceptable; Frozen at -70°C: 1 month

Performed:
Sun-Sat

Remarks:
Specimen source preferred.

ORDERING

Synonyms:

- C. Trachomatis
- Chlamydia Trachomatis
- LAB3131-VML
- LAB3131VML

Ordering Recommendations:
Not recommended for routine detection of Chlamydia trachomatis (CT). Use to assess suspected treatment failure. May be considered for anatomic locations for which amplified testing has not been validated.

Performed:
Sun-Sat

Methodology:
Cell Culture/Immunofluorescence

Reported:
2-5 days

Notes:
Nucleic acid amplification testing is recommended for detection of Chlamydia trachomatis from endocervical or urethral specimens. Refer to Chlamydia trachomatis by Transcription-Medicated Amplification (TMA) (ARUP test code 0060243). Specimen must be collected and transported with test-specific kit (ARUP supply #55224).

Positive Chlamydia cultures are confirmed for trachomatis by Chlamydia trachomatis by Transcription-Mediated Amplification (TMA) at no additional charge. Some specimen types acceptable for the Chlamydia trachomatis Culture may require a disclaimer for the TMA confirmation assay.

RESULTS INTERPRETATION

Reference Interval:
Culture negative for Chlamydia trachomatis.

Methodology:
Cell Culture/Immunofluorescence

ADDITIONAL INFORMATION

Chlamydia Antibody Panel, IgG & IgM by IFA

LAB790

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- Chlamydia IgG, IgM Ab
- CT IgG, IgM Ab
- LAB790-VML
- LAB790VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or hyperlipemic sera.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Fri

ORDERING

Synonyms:

- Chlamydia IgG, IgM Ab
- CT IgG, IgM Ab
- LAB790-VML
- LAB790VML

Ordering Recommendations:
Differentiate between Chlamydophila species (C. psittaci, C. pneumoniae). Differentiate early IgM response to infection from persistent low-level titer. Because of cross-reactivity, a C. pneumoniae-specific reaction will exhibit titers two-fold or greater than C. trachomatis or C. psittaci serology. Limited value in the diagnosis of most oculogenital (eg, eyes, genitalia) chlamydial infections.

Performed:
Sun-Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
< 1:64 C. pneumoniae IgG.
< 1:64 C. psittaci IgG.
< 1:64 C. trachomatis IgG.
< 1:20 C. pneumoniae IgM.
< 1:20 C. psittaci IgM.
< 1:20 C. trachomatis IgM.

Interpretive Data:
Refer to individual components.

Chlamydia Antibody Panel, IgM by IFA

LAB1208

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- Chlamydia IgM Ab
- CT IgM Ab
- LAB1208-VML
- LAB1208VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or hyperlipemic sera.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon-Sat

ORDERING

Synonyms:

- Chlamydia IgM Ab
- CT IgM Ab
- LAB1208-VML
- LAB1208VML

Ordering Recommendations:
A combined IgG and IgM antibody panel is available (refer to Chlamydia Antibody Panel, IgG & IgM by IFA (0065100)). Differentiate between Chlamydophila species (C. psittaci, C. pneumoniae). Differentiate early IgM response to infection from persistent low-level titer. Because of cross-reactivity, a C. pneumoniae-specific reaction will exhibit titers two-fold or greater than C. trachomatis or C. psittaci serology. Limited value in the diagnosis of most oculogenital (eg, eyes, genitalia) chlamydial infections.

Performed:
Mon-Sat

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
< 1:20 C. trachomatis IgM.
< 1:20 C. pneumoniae IgM.
< 1:20 C. psittaci IgM.

Interpretive Data:

The Chlamydia antibody test contains both species- and genus-specific antigens, and serological cross-reactions may be seen in both acute and convalescent samples (less than 1:128). A C. pneumoniae-specific reaction will exhibit titers twofold or greater than titers observed with C. trachomatis or C. psittaci serology. Ideally, acute and convalescent samples should be tested simultaneously at the same facility. If the sample submitted was collected during the acute-phase of illness, submit a marked convalescent sample within 25 days for paired testing. Seroconversion, a fourfold or greater rise in antibody titer between acute and convalescent sera, is considered strong evidence of recent infection.

The Chlamydia microimmunofluorescent assay utilizes C. psittaci, C. pneumoniae, and nine serotypes of C. trachomatis. It does not include the LGV strains of C. trachomatis.

Methodology:

Coccidioides Antibodies, IgM and IgG by Immunoassay, Serum

LAB791

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- Valley fever
- CF
- Coccidioides immitis
- Coccidioidomycosis
- Precipitin
- TP
- LAB791-VML
- LAB791VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 0.6 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens.

Unacceptable Conditions:
Other body fluids. Contaminated, hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

Remarks:
Mark specimens plainly as "acute" or "convalescent."

ORDERING

Synonyms:

- Valley fever
- CF
- Coccidioides immitis
- Coccidioidomycosis
- Precipitin
- TP
- LAB791-VML
- LAB791VML

Ordering Recommendations:
Use to screen for the presence of coccidioidal IgM and IgG antibodies in serum. Not recommended as a standalone test. For screening with confirmation, refer to Coccidioides Antibodies Reflexive Panel, Serum (3001982).

Performed:
Sun-Sat

Methodology:
Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-3 days

Notes:
This immunoassay uses recombinant and native Coccidioides antigens, including CF and TP antigens.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Coccidioides Antibody, IgG by ELISA	0.9 IV or less
Coccidioides Antibody, IgM by ELISA	0.9 IV or less

Interpretive Data:
Refer to report.

Component	Unit Of Measure	Interpretation
Coccidioides Antibody, IgG by ELISA	0.9 IV or less 1.0-1.4 IV 1.5 IV or greater	Negative - No significant level of Coccidioides IgG antibody detected. Equivocal - Questionable presence of Coccidioides IgG antibody detected. Repeat testing in 10-14 days may be helpful. Positive - Presence of IgG antibody to Coccidioides detected, suggestive of current or past infection.
Coccidioides Antibody, IgM by ELISA	0.9 IV or less 1.0-1.4 IV 1.5 IV or greater	Negative - No significant level of Coccidioides IgM antibody detected. Equivocal - Questionable presence of Coccidioides IgM antibody detected. Repeat testing in 10-14 days may be helpful. Positive - Presence of IgM antibody to Coccidioides detected, suggestive of current or recent infection.

Methodology:
Enzyme-Linked Immunosorbent Assay (ELISA)

ADDITIONAL INFORMATION

CPT Codes:
86635 x2

Section:
RF-ARUP

Remarks:
Mark specimens plainly as "acute" or "convalescent."

Notes:
This immunoassay uses recombinant and native Coccidioides antigens, including CF and TP antigens.

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:

Coxiella burnetii (Q-Fever) Antibody IgG, Phase I and II with Reflex to Titer

LAB1209

ORDERING INFO

Collect:
Serum separator tube (SST).

Synonyms:

- Coxiella burnetii
- Q Fever Phases I and II antibody
- Coxiella Titer
- LAB1209-VML
- LAB1209VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" and "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- Coxiella burnetii
- Q Fever Phases I and II antibody
- Coxiella Titer
- LAB1209-VML
- LAB1209VML

Ordering Recommendations:
Confirm infectious agent as C. burnetii (Q-fever) in symptomatic patients. Recommend testing of acute and convalescent sera.

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-6 days

Notes:
If either C. Burnetii Abs IgG Phase I and/or Phase II result is indeterminate or positive, then titer(s) will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Component	Reference Interval
C. burnetii (Q-Fever) Ab, Phase I IgG	Negative
C. burnetii (Q-Fever) Ab, Phase II IgG	Negative

Interpretive Data:
Single phase II IgG titers of 1:256 and greater are considered evidence of C. burnetii infection at some time prior to the date of the serum specimen. Phase I antibody titers of 1:16 and greater are consistent with chronic infection or convalescent phase of Q-fever.

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

ADDITIONAL INFORMATION

CPT Codes:
86638 x2; if reflexed add 86638 per titer

Section:
RF-ARUP

Notes:
If either C. Burnetii Abs IgG Phase I and/or Phase II result is indeterminate or positive, then titer(s) will be added. Additional charges apply.

Resulting Laboratory:

Cryptosporidium Antigen by EIA

LAB907

ORDERING INFO

Collect:
Stool.

Synonyms:

- Coccidia
- Cryptosporidium Antigen
- Cryptosporidium Antigen, Feces
- Ova and Parasite Exam by EIA
- LAB907-VML
- LAB907VML

SPECIMEN REQUIREMENTS

Collect:
Stool.

Specimen Preparation:
Transport 5 g stool in unpreserved stool transport vial (ARUP Supply #40910) available online through eSupply using ARUP Connect or contact ARUP Client Services at(800) 522-2787. (Min: 1 g) Preserving in 10 percent formalin (within 1 hour of collection) is also acceptable.

Unacceptable Conditions:
Specimens in any other preservative than indicated above.

Storage/Transport Temperature:
Unpreserved: Frozen.
Preserved: Room temperature.

Stability (from collection to initiation):
Unpreserved: Ambient: 2 hours; Refrigerated: 24 hours; Frozen: 1 week
Preserved: Ambient: 9 months; Refrigerated: 9 months; Frozen: Unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- Coccidia
- Cryptosporidium Antigen
- Cryptosporidium Antigen, Feces
- Ova and Parasite Exam by EIA
- LAB907-VML
- LAB907VML

Ordering Recommendations:
Test for persistent diarrhea (>14 days) or known risk factors if Cryptosporidium spp is the suspected infectious agent.

Performed:
Sun-Sat

Methodology:
Qualitative Enzyme Immunoassay

Reported:
1-2 days

Notes:
This immunoassay is not a substitute for comprehensive testing. Refer to Ova & Parasite Exam, Fecal (Immunocompromised or Travel History) (ARUP test code 3001662).

Echinococcus Antibody, IgG

LAB1234

ORDERING INFO

Collect:
Serum separator tube (SST) or plain red.

Synonyms:

- Echinococcosis
- Hydatiosis
- Hydatic disease
- Tapeworm
- LAB1234-VML
- LAB1234VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST) or plain red.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.15 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of acute specimens. Mark specimens plainly as acute or convalescent.

Unacceptable Conditions:
Contaminated, heat-inactivated, grossly hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Preferred transport temp: Refrigerated. Also acceptable: Frozen

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Mon, Thu

ORDERING

Synonyms:

- Echinococcosis
- Hydatiosis
- Hydatic disease
- Tapeworm
- LAB1234-VML
- LAB1234VML

Ordering Recommendations:
Adjunct to other diagnostic tests (eg, imaging) for echinococcosis. Patient's travel history is necessary to aid in test interpretation.

Performed:
Mon, Thu

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Echinococcus Antibody IgG	8 U or less

Interpretive Data:

Patients with collagen vascular diseases, hepatic cirrhosis, schistosomiasis, and other parasitic infections can produce false-positive results. There is a strong cross-reaction between echinococcosis- and cysticercosis-positive sera.

Seroconversion between acute and convalescent sera is considered strong evidence of recent infection. The best evidence for infection is a significant change on two appropriately timed specimens where both tests are done in the same laboratory at the same time.

Component	Interpretation
Echinococcus Antibody IgG	0-8 U.....Negative: No significant level of Echinococcus IgG antibodies detected. 9-11 U.....Equivocal: Recommend repeat testing in 2-4 weeks with fresh sample. 12 U or greater.....Positive: IgG antibodies to Echinococcus detected, indicating current or past infection.

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Ehrlichia chaffeensis Antibodies, IgG & IgM by IFA

LAB794

ORDERING INFO

Collect:
Serum Separator Tube.

Synonyms:

- E. chaffeensis antibodies
- E. Chaffeensis IgG, IgM Ab
- Ehrlichiosis IFA test
- LAB794-VML
- LAB794VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as acute or convalescent.

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Tue, Fri

ORDERING

Synonyms:

- E. chaffeensis antibodies
- E. Chaffeensis IgG, IgM Ab
- Ehrlichiosis IFA test
- LAB794-VML
- LAB794VML

Ordering Recommendations:
Diagnose infection from Ehrlichia chaffeensis.

Performed:
Tue, Fri

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-5 days

Notes:
Human ehrlichiosis is a tick-borne disease caused by rickettsial-like agents. Two forms, human monocytic ehrlichiosis (HME) and human granulocytic ehrlichiosis (HGE), have been described. HME is often referred to as "spotless" or rashless Rocky Mountain spotted fever, and has been reported in various regions of the United States. The causative agent of HME has been identified as Ehrlichia chaffeensis. Infected individuals produce specific antibodies to Ehrlichia chaffeensis which can be detected by an immunofluorescent antibody (IFA) test.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Ehrlichia chaffeensis Antibody, IgG	Less than 1:64
Ehrlichia chaffeensis Antibody, IgM	Less than 1:16

Interpretive Data:

Component	Interpretation
Ehrlichia chaffeensis Antibody, IgG by IFA	< 1:64 Negative-No significant level of Ehrlichia chaffeensis IgG antibody detected. 1:64-1:128 Equivocal-Questionable presence of Ehrlichia chaffeensis IgG antibody detected. Repeat testing in 10-14 days may be helpful. >=1:256 Positive-Presence of IgG antibody to Ehrlichia chaffeensis detected, suggestive of current or past infection.
Ehrlichia chaffeensis Antibody, IgM by IFA	< 1:16 Negative-No significant level of Ehrlichia chaffeensis IgM antibody detected. >= 1:16 Positive-Presence of IgM antibody to Ehrlichia chaffeensis detected, suggestive of current or recent infection.

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Specimens in media or preservatives.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 48 hours; Frozen: 2 weeks

Storage/Transport Temperature:
Frozen.

Synonyms:

- E. histolytica Ag
- Entamoeba histolitica Antigen
- LAB3165-VML
- LAB3165VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-2 days

Ordering Recommendations:
Test for persistent diarrhea (>14 days) or known risk factors if E. histolytica is the suspected infectious agent.

Reference Interval:
Negative

Methodology:
Qualitative Enzyme Immunoassay

Section:
RF-ARUP

CPT Codes:
87337

Giardia lamblia Antibodies Panel by ELISA

LAB1231

ORDERING INFO

Collect:
Plain red or serum separator tube (SST).

Synonyms:

- LAB1231-VML
- LAB1231VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube (SST).

Specimen Preparation:
Remove serum from cells within one hour. Transfer 1 mL serum to an ARUP Standard Transport Tube and freeze immediately. (Min: 0.5 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 5 weeks

Performed:
Varies

ORDERING

Giardia Antigen by EIA

LAB1319

ORDERING INFO

Collect:
Stool.

Synonyms:

- G lamblia antigaten EIA
- Giardia EIA
- Giardia lamblia Antigen
- Ova and Parasite Exam by EIA
- LAB1319-VML
- LAB1319VML

SPECIMEN REQUIREMENTS

Collect:
Stool.

Specimen Preparation:
Transport 5 g stool in unpreserved stool transport vial (ARUP Supply #40910) available online through eSupply using ARUP Connect or contact ARUP Client Services at (800) 522-2787. (Min: 1 g) Preserving in 10 percent formalin (within 1 hour of collection) is also acceptable.

Storage/Transport Temperature:
Unpreserved: Frozen. Preserved: Room temperature.

Stability (from collection to initiation):
Unpreserved: Ambient: 2 hours; Refrigerated: 24 hours; Frozen: 1 week
Preserved: Ambient: 9 months; Refrigerated: 9 months; Frozen: Unacceptable

Performed:
Sun-Sat

ORDERING

Synonyms:

- G lamblia antigaten EIA
- Giardia EIA
- Giardia lamblia Antigen
- Ova and Parasite Exam by EIA
- LAB1319-VML
- LAB1319VML

Ordering Recommendations:
Test for persistent diarrhea (>14 days) or known risk factors if Giardia duodenalis (synonyms Giardia lamblia, Giardia intestinalis) is the suspected infectious agent.

Performed:
Sun-Sat

Haemophilus influenzae b Antibody, IgG

LAB1237

ORDERING INFO

Collect:
Serum separator tube. "Pre" and 30-day "post" Haemophilus influenzae b vaccination specimens should be submitted together for testing. "Post" specimen should be drawn 30 days after immunization and must be received within 60 days of "pre" specimen.

Synonyms:

- HIB (Haemophilus influenzae Type B) Vaccine Response
- H. influenzae Antibody
- Haemophilus influenzae b Vaccine Response
- Vaccine Response
- LAB1237-VML
- LAB1237VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. "Pre" and 30-day "post" Haemophilus influenzae b vaccination specimens should be submitted together for testing. "Post" specimen should be drawn 30 days after immunization and must be received within 60 days of "pre" specimen.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.15 mL) Mark specimens clearly as "Pre-Vaccine" or "Post-Vaccine".

Unacceptable Conditions:
Plasma or other body fluids. Contaminated, hemolyzed or, severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- HIB (Haemophilus influenzae Type B) Vaccine Response
- H. influenzae Antibody
- Haemophilus influenzae b Vaccine Response
- Vaccine Response
- LAB1237-VML
- LAB1237VML

Ordering Recommendations:
Evaluate the ability of a patient to produce antibody to a protein conjugated bacterial (H. influenza) vaccine to rule out antibody deficiency.

Performed:
Sun-Sat

Methodology:
Quantitative Multiplex Bead Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
< 1.0 µg/mL = Antibody concentration not protective.
>= 1.0 µg/mL = Antibody to H. influenzae b detected. Suggestive of protection.

Interpretive Data:

Responder status is determined according to the ratio of post-vaccination concentration to pre-vaccination concentration of Haemophilus influenza b antibody, IgG as follows:
1. If the post-vaccination concentration is less than 3.0 µg/mL, the patient is considered to be a nonresponder.
2. If the post-vaccination concentration is greater than or equal to 3.0 µg/mL, a patient with a ratio of greater than or equal to 4 is a good responder, a ratio of 2-4 is a weak responder, and a ratio of less than 2 is considered a nonresponder.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Helicobacter pylori, Breath Test

LAB6570

ORDERING INFO

Collect:

Breath Test Kit IDkit Hp Two (ARUP Supply #58132) available online through e-Supply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787.

Synonyms:

- 13C Urea Breath Test
- BreathID
- H. pylori Urea Breath Test
- Helicobactor
- Helicobactor pylori Breath Test
- UBT
- Ulcer Breath Test
- Urea Breath Test
- H pylori
- Pylori
- UBIT
- LAB6570-VML
- LAB6570VML

SPECIMEN REQUIREMENTS

Patient Preparation:

Remind the patient that there is 84 mg of phenylalanine per packet of Citrica Powder. Phenylketonurics restrict dietary phenylalanine.

The patient should have fasted at least one hour before administering the solution. The patient should not have taken antimicrobials, proton pump inhibitors (e.g., Prilosec, Prevacid, Aciphex, Nexium), or bismuth preparations (e.g., Pepto Bismol) within two weeks prior to administering the test.

Collect:

Breath Test Kit IDkit Hp Two (ARUP Supply #58132) available online through e-Supply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787.

Specimen Preparation:

1) Label breath collection bags with patient name, MRN, date and time of collection, and indicate Baseline (blue) or Post Ingestion (gray).
2) Collect the blue Baseline specimen according to the instructions in the Breath Test Kit, IDkit Hp (TM) Two. Instruct the patient to hold their breath for 4-5 seconds, and then exhale into the blue Baseline collection bag until the bag is full.
3) Prepare the test drink by adding 150 to 200 mL (5.1 to 6.8 oz.) water, the Citrica Powder, and the urea tablet to the provided drinking cup, closing the lid firmly, and shaking thoroughly until the powder and tablet are completely dissolved.
4) Administer the test drink within two hours of preparation per kit instructions and precautions. Regardless of age and body weight, the patient must consume the entire solution through the provided straw within 2 minutes.
5) Collect the gray Post Ingestion specimen 15 minutes after ingestion of the test drink, but no later than 20 minutes post ingestion. Instruct the patient to hold their breath for 4-5 seconds, and then exhale into the gray Post Ingestion collection bag until the bag is full.
6) Ensure the caps on the bag mouthpieces are secured (push until they click).

Unacceptable Conditions:

Underinflated or uncapped bags. Specimens from patients younger than 3 years. Specimens collected using the BreathTek UBT Kit (blue and pink collection bags).

Storage/Transport Temperature:

CRITICAL ROOM TEMPERATURE. Do not freeze. Protect bags from sharp objects and direct sunlight. Refrain from applying any external pressure on the breath sample bags.

Stability (from collection to initiation):

Ambient: 2 weeks; Refrigerated: Unacceptable; Frozen: Unacceptable.

Performed:

Sun-Sat

ORDERING

Synonyms:

- 13C Urea Breath Test
- BreathID
- H. pylori Urea Breath Test
- Helicobactor
- Helicobactor pylori Breath Test
- UBT
- Ulcer Breath Test
- Urea Breath Test
- H pylori
- Pylori
- UBIT
- LAB6570-VML
- LAB6570VML

Ordering Recommendations:
Aids in the initial diagnosis and posttreatment monitoring of Helicobacter pylori infection in adult patients and in pediatric patients 3-17 years of age.Posttreatment monitoring of H. pylori should be performed no sooner than 6 weeks after treatment for H. pylori infection. Earlier assessment may give false results.

Performed:
Sun-Sat

Methodology:
Qualitative Spectrophotometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A negative result does not rule out the possibility of Helicobacter pylori infection. If clinical signs are suggestive of H. pylori infection, retest with a new specimen or an alternate method.

Known causes of false-negative results include:

1. Ingestion of antimicrobials, proton pump inhibitors, and bismuth preparations during the preceding 2 weeks.

2. Administration of the breath test less than 6 weeks after completion of definitive therapy to eradicate H. pylori.

3. Premature or late collection of the postdose specimen.

Known causes of false-positive results include:

1. Patients with achlorhydria.

2. Rinsing the testing solution in the mouth or not using the straw provided in the kit, which can allow contact with urease-positive bacteria.

3. The presence of other gastric spiral organisms such as Helicobacter heilmannii.

Methodology:
Qualitative Spectrophotometry

Histoplasma Antibodies by Complement Fixation and Immunodiffusion

LAB909

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Histoplasma capsulatum
- Histoplasmosis
- M antigen
- H antigen
- Precipitin
- LAB909-VML
- LAB909VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP standard transport tube. (Min: 0.8 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Histoplasma capsulatum
- Histoplasmosis
- M antigen
- H antigen
- Precipitin
- LAB909-VML
- LAB909VML

Ordering Recommendations:
Aids in the diagnosis of histoplasmosis. Testing in conjunction with Histoplasma Antigen Quantitative by EIA, Serum (0092522) and Histoplasma Galactomannan Antigen Quantitative by EIA, Urine (2009418) is recommended.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Complement Fixation/Qualitative Immunodiffusion

Reported:
3-6 days

Notes:
The immunodiffusion component of this test detects total antibodies against the H and M antigens of Histoplasma capsulatum. The complement fixation component of this test detects total antibodies to mycelial and yeast antigens of Histoplasma.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Histoplasma Antibodies by ID	Not detected.
Histoplasma Mycelia Antibodies by CF	Less than 1:8
Histoplasma Yeast Antibodies by CF	Less than 1:8

Interpretive Data:
Refer to report.

IGHV Mutation Analysis by Sequencing

LAB3264

ORDERING INFO

Collect:
Lavender (EDTA) or bone marrow (EDTA).

Synonyms:

- IGHV genes
- IGHV mutation status
- IgVH gene mutation
- LAB3264-VML
- LAB3264VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or bone marrow (EDTA).

Specimen Preparation:
Whole Blood: Transport 5 mL whole blood. (Min: 1 mL)
Bone Marrow: Transport 3 mL bone marrow. (Min: 1 mL)
Specimens must be received within 48 hours of collection due to lability of RNA.

Unacceptable Conditions:
Serum, plasma, CSF, bone core, or FFPE tissue. Specimens collected in anticoagulants other than EDTA. Severely hemolyzed or clotted specimens.

Storage/Transport Temperature:
Whole Blood or Bone Marrow: CRITICAL REFRIGERATED. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: 48 hours; Frozen: Unacceptable

Performed:
Varies

ORDERING

Synonyms:

- IGHV genes
- IGHV mutation status

Collect:
Pericardial fluid, respiratory, or tissue specimens.

Specimen Preparation:
Fluid: Prepare two duplicate slides. OR transfer 1 mL fluid to a sterile container.
Tissue: Transfer tissue to a sterile container and place on gauze moistened with sterile non-bacteriostatic saline to prevent drying.

Unacceptable Conditions:
Non-respiratory specimens. Specimens in preservatives or viral transport medium.

Storage/Transport Temperature:
Refrigerated. OR frozen if transport occurs more than 48 hours after collection.

Stability (from collection to initiation):
Fluid or Tissue: Ambient: 12 hours; Refrigerated: 48 hours; Frozen: 1 week
Slides: Ambient: 1 week; Refrigerated: 1 week; Frozen: 1 week

Performed:
Sun-Sat

Remarks:
Specimen source preferred.

ORDERING

Synonyms:

- L. pneumophilia DFA
- Legionella Smear, DFA
- LAB1352-VML
- LAB1352VML

Ordering Recommendations:
Use for the rapid identification of L. pneumophila; sensitivity is dependent on patient population and specimen type. Molecular testing is generally preferred; refer to Legionella Species by Qualitative PCR (2010125).

Performed:
Sun-Sat

Methodology:
Direct Fluorescent Antibody Stain

Reported:
1-2 days

Notes:
A negative stain result does not exclude the possibility of infection. False-negative results may occur due to sampling errors or a low number of organisms in the specimen. DFA is not recommended for diagnosing Legionella pneumophila-caused infections. For diagnosing Legionella pneumophila-caused infections, refer to Legionella Species, Culture (ARUP test code 0060113), Legionella Species by Qualitative PCR (ARUP test code 2010125) for amplified DNA testing of respiratory specimens, or Legionella pneumophila Antigen, Urine (ARUP test code 0070322) for urine specimens.

RESULTS INTERPRETATION

Reference Interval:
Negative

Methodology:
Direct Fluorescent Antibody Stain

ADDITIONAL INFORMATION

CPT Codes:

Legionella pneumophila Antigen, Urine

LAB886

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Urine Legionella antigen
- Legionella Antigen, Urine
- Legionella Urinary Antigen
- LAB886-VML
- LAB886VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Mix specimen well. Transfer 4 mL urine to an ARUP Standard Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Specimens in preservatives.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 2 weeks; Frozen: 2 weeks

Performed:
Sun-Sat

ORDERING

Synonyms:

- Urine Legionella antigen
- Legionella Antigen, Urine
- Legionella Urinary Antigen
- LAB886-VML
- LAB886VML

Ordering Recommendations:
Provide retrospective evidence of suspected Legionella pneumophila infection.

Performed:
Sun-Sat

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
This assay detects Legionella pneumophila serogroup one (1) antigen. A negative test result does not rule out the possibility of Legionella infection due to other serogroups or species of Legionella. A positive result may indicate a recent or remote infection with serogroup 1.

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay

Mycoplasma pneumoniae Antibodies, IgG & IgM

LAB656

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- M pneumoniae antibodies IgG, IgM
- M. pneumoniae antibodies
- LAB656-VML
- LAB656VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.1 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- M pneumoniae antibodies IgG, IgM
- M. pneumoniae antibodies
- LAB656-VML
- LAB656VML

Ordering Recommendations:
May aid in the diagnosis of Mycoplasma pneumoniae in patient with persistent pneumonia that is outside of the expected acute phase.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Mycoplasma Pneumoniae Antibody IgG	Less than or equal to 0.09 U/L
Mycoplasma Pneumoniae Antibody IgM	Less than or equal to 0.76 U/L

Interpretive Data:

Component	Interpretation
Mycoplasma pneumoniae Antibody, IgG	< 0.10 U/L: Negative 0.10-0.32 U/L: Equivocal > 0.32 U/L: Positive
Mycoplasma pneumoniae Antibody, IgM	0.76 U/L or less: Negative - No clinically significant amount of M. pneumoniae IgM antibody detected. 0.77-0.95 U/L: Low Positive - M. pneumoniae-specific IgM presumptively detected. Collection of a follow-up sample in one to two weeks is recommended to assure reactivity. 0.96 U/L or greater: Positive - Highly significant amount of M. pneumoniae-specific IgM antibody detected. However, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Mycoplasma pneumoniae by PCR

LAB3170

ORDERING INFO

Collect:
Respiratory specimen: Bronchoalveolar lavage (BAL), bronchial brushings, nasopharyngeal swab, sputum, tracheal aspirates or pleural fluid. OR CSF.

Synonyms:

- Mycoplasma by PCR
- Mycoplasma pneumoniae DNA PCR
- LAB3170-VML
- LAB3170VML

SPECIMEN REQUIREMENTS

Collect:
Respiratory specimen: Bronchoalveolar lavage (BAL), bronchial brushings, nasopharyngeal swab, sputum, tracheal aspirates or pleural fluid. OR CSF.

Specimen Preparation:
CSF: Transfer 1 mL CSF to a sterile container. (Min: 0.5 mL).
Fluid: Transfer 2 mL respiratory specimen to a sterile container. (Min: 0.5 mL) Also acceptable: Transfer to viral transport media (ARUP supply #12884). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787
Swabs: Place in viral transport media. Place each specimen in an individually sealed bag.

Unacceptable Conditions:
Tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 5 days; Frozen: 1 year.

Performed:
Mon, Wed, Fri

Remarks:
Specimen source required.

ORDERING

Synonyms:

- Mycoplasma by PCR
- Mycoplasma pneumoniae DNA PCR
- LAB3170-VML
- LAB3170VML

Ordering Recommendations:
Detect M. pneumoniae bacteria.

Performed:
Mon, Wed, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-4 days

RESULTS INTERPRETATION

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Neisseria meningitidis Tetravalent Antibodies (Serogroups A, C, W-135 and Y), IgG

LAB1254

ORDERING INFO

Collect:
Serum separator tube. Postimmunization specimen should be drawn 30 days after immunization and, if shipped separately, must be received within 60 days of preimmunization specimen.

Synonyms:

- Neisseria meningitidis
- Meningococcal IgG Vaccine Response
- N. Meningitidis IgG Vaccine Response
- Vaccine Response
- LAB1254-VML
- LAB1254VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Postimmunization specimen should be drawn 30 days after immunization and, if shipped separately, must be received within 60 days of preimmunization specimen.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL) MARK SPECIMENS CLEARLY AS PRE- OR POSTPNEUMOCOCCAL VACCINE SO SPECIMENS WILL BE SAVED AND TESTED SIMULTANEOUSLY.

Unacceptable Conditions:
Plasma or other body fluids. Contaminated, hemolyzed or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated. Pre- and postpneumococcal vaccine specimens can be submitted separately or together for testing.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles).

Performed:
Mon

ORDERING

Synonyms:

- Neisseria meningitidis
- Meningococcal IgG Vaccine Response
- N. Meningitidis IgG Vaccine Response
- Vaccine Response
- LAB1254-VML
- LAB1254VML

Ordering Recommendations:
Use to assess immunocompetence following Neisseria meningitidis vaccination. To assess suspected immunodeficiency, use pre- and postvaccination serology. Do not use for diagnosis of infection or serotyping.

Performed:
Mon

Methodology:
Quantitative Multiplex Bead Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

N. meningitidis A, C, W-135 and Y, IgG:
0.9 µg/mL or less: Antibody concentration not protective.
1.0-2.0 µg/mL: Equivocal.
2.1 µg/mL or greater: Antibody to Neisseria meningitidis detected. Suggestive of protection.

Responder status is determined according to the ratio of the one month post-vaccination concentration to pre-vaccination concentration of IgG antibodies to N. meningitidis (Types A, C, Y, and W-135) as follows:

1. If the one month post-vaccination concentration is less than 3.0 µg/mL, the patient is considered to be a non-responder.
2. If the one month post-vaccination concentration is greater than or equal to 3.0 µg/mL, a patient with a ratio of greater than or equal to 4 is a good responder, a ratio of 2-4 is a weak responder, and a ratio of less than 2 is considered a non-responder

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Saccharomyces cerevisiae Antibodies, IgG & IgA

LAB548

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- ASCA
- ASCA Abs
- ASCA IgA
- ASCA IgG
- S. cerevisiae
- LAB548-VML
- LAB548VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- ASCA
- ASCA Abs
- ASCA IgA
- ASCA IgG
- S. cerevisiae
- LAB548-VML
- LAB548VML

Ordering Recommendations:
May aid in the diagnosis of Crohn disease. Test by itself is not diagnostic and should be used in conjunction with other parameters to confirm disease. Inflammatory Bowel Disease Differentiation Panel (3003748) is the preferred test.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-2 days

Notes:
This test may be a useful tool for distinguishing ulcerative colitis (UC) from Crohn disease (CD) in patients with suspected inflammatory bowel disease.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval	
S. cerevisiae Antibody, IgG	20.0 Units or less	Negative
	20.1-24.9 Units	Equivocal
	25.0 Units or greater	Positive
S. cerevisiae Antibody, IgA	20.0 Units or less	Negative
	20.1-24.9 Units	Equivocal
	25.0 Units or greater	Positive

Interpretive Data:
Saccharomyces cerevisiae IgG antibodies are found in 60-70% of Crohn disease (CD) patients and 10-15% of ulcerative colitis (UC) patients. Saccharomyces cerevisiae IgA antibodies are found in about 35% of CD patients but less than 1% in UC patients. Detection of both Saccharomyces IgG and IgA antibodies in the same serum specimen is highly specific for CD.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Salmonella typhi and *paratyphi* Antibodies

LAB1267

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Typhoid Fever
- S typhi H and O antibodies
- S. typhii, s. paratyphi antibodies
- LAB1267-VML
- LAB1267VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolytic, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- Typhoid Fever
- S typhi H and O antibodies
- S. typhii, s. paratyphi antibodies
- LAB1267-VML
- LAB1267VML

Ordering Recommendations:
May be used to determine past exposure to S. typhii (eg, infection or vaccination) and S. paratyphi. This test cannot be used to confirm acute salmonellosis. If systemic symptoms of acute salmonellosis are present, the preferred tests are Stool Culture and E. coli Shiga-like Toxin by EIA (0060134) and Blood Culture (0060102) if typhoid fever is suspected.

Performed:
Tue, Thu, Sat

Methodology:
Qualitative Immunoblot

Reported:
2-5 days

Notes:
This assay detects antibodies directed against 5 Salmonella typhi and paratyphi antigens: O Type D, O Type Vi, H Type A, H Type B or H Type D.

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Refer to report.

- LAB3812VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Postimmunization specimen should be drawn 30 days after immunization and, if shipped separately, must be received within 60 days of preimmunization specimen.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1.5 mL serum to an ARUP standard transport tube. (Min: 0.25 mL) MARK SPECIMENS CLEARLY AS "PRE" OR "POST" SO SPECIMENS WILL BE SAVED AND TESTED SIMULTANEOUSLY.

Unacceptable Conditions:
Plasma or other body fluids. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 60 days (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Immune Response
- pneumo conjugate vaccine
- Pneumo polysaccharide vaccine
- Pneumococcal Antibodies
- Strep Antibodies 14 serotypes
- Strep Pneumo Antibodies
- S. Pneumoniae Vaccine
- Strep Pneumoniae Antibody
- Strep Vaccine
- Streptococcus pneumoniae Immune Response
- Streptococcus pneumoniae Vaccine Response
- Vaccine Response
- LAB3812-VML
- LAB3812VML

Ordering Recommendations:
Use to evaluate antibody production and rule out antibody deficiency in patients vaccinated with a pure polysaccharide vaccine (eg, Pneumovax) or protein conjugated vaccine (eg, Prevnar or Vaxneuvance).

Performed:
Sun-Sat

Methodology:
Quantitative Multiplex Chemiluminescent Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Interpretive Data:
A pre- and postvaccination comparison is required to adequately assess the humoral immune response to the pure polysaccharide Pneumovax 23 (PNX) and/or the protein conjugated Prevnar 7 (P7), Prevnar 13 (P13), Prevnar 20 (P20), and Vaxneuvance (V15) Streptococcus pneumoniae vaccines. Prevaccination samples should be collected prior to vaccine administration. Postvaccination samples should be obtained at least 4 weeks after immunization. Testing of postvaccination samples alone will provide only general immune status of the individual to various pneumococcal serotypes.

In the case of pure polysaccharide vaccine, indication of immune system competence is further delineated as an adequate response to at least 50 percent of the serotypes in the vaccine challenge for those 2-5 years of age and to at least 70 percent of the serotypes in the vaccine challenge for those 6-65 years of age. Individual immune response may vary based on age, past exposure, immunocompetence, and pneumococcal serotype.

Responder Status Antibody Ratio

Nonresponder . . . . . Less than twofold increase and postvaccination concentration less than 1.3 ug/mL

Good responder . . . . . .At least a twofold increase and/or a postvaccination concentration greater than or equal to 1.3 ug/mL

A response to 50-70 percent or more of the serotypes in the vaccine challenge is considered a normal humoral response. (Daly, 2014) Antibody concentration greater than 1.0-1.3 ug/mL is generally considered long-term protection. (Daly, 2015)

Streptococcus pneumoniae Antigen, CSF

LAB3182

ORDERING INFO

Collect:
CSF.

Synonyms:

- Pneumococcal Antigen
- S. pneumoniae Antigen
- S. pneumoniae antigen CSF
- LAB3182-VML
- LAB3182VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 1 mL CSF to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimen types other than CSF.

Storage/Transport Temperature:
Refrigerated or frozen.

Stability (from collection to initiation):
Stability: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 1 week

Performed:
Sun-Sat

ORDERING

Synonyms:

- Pneumococcal Antigen
- S. pneumoniae Antigen
- S. pneumoniae antigen CSF
- LAB3182-VML
- LAB3182VML

Ordering Recommendations:
Aid in the diagnosis of pneumococcal meningitis.

Performed:
Sun-Sat

Methodology:
Qualitative Immunochromatography

Reported:
Within 24 hours

Notes:
Patients who have received the S. pneumoniae vaccines may test positive in the 48 hours following vaccination. Avoid antigen detection testing for at least 5 days after receiving vaccination.

The College of American Pathologists (CAP) requires that bacterial antigen detection testing performed on CSF specimens be confirmed by culture (CAP MIC.22550). When S. pneumoniae antigen detection on CSF specimens is ordered by the University of Utah Hospital, Huntsman Cancer Hospital, or the VA Hospital of Salt Lake City, a CSF culture will be added automatically (see 0060106 for submission requirements). All other CSF specimens will be processed with the assumption that a culture was performed before sending to ARUP unless a specific request for culture is included with the test order. Additional charges apply

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
False-positives may occur because of cross-reactivity with other members of S. mitis group. Clinical correlation is recommended.

Methodology:
Qualitative Immunochromatography

ADDITIONAL INFORMATION

Strongyloides Antibody, IgG by ELISA, Serum

LAB3831

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plain Red.

Synonyms:

- Ova and Parasite Exam
- Strongyloides IgG
- LAB3831-VML
- LAB3831VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min. 0.3 mL)

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Ova and Parasite Exam
- Strongyloides IgG
- LAB3831-VML
- LAB3831VML

Ordering Recommendations:
Aid in the diagnosis of Strongyloides infection. Positive results in patients from endemic areas may not represent active infection.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 20, 2018

0.9 IV or less	Negative - No significant level of Strongyloides IgG antibody detected.
1.0 IV	Equivocal - The Strongyloides IgG antibody result is borderline and therefore inconclusive. Recommend retesting the patient in 2-4 weeks, if clinically indicated.
1.1 IV or greater	Positive - IgG antibodies to Strongyloides detected, which may suggest current or past infection.

Interpretive Data:
False-positive results may occur with prior exposure to other helminth infections. Testing low-prevalence populations may also result in false-positive results.

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Toxoplasma gondii by PCR

LAB3866

ORDERING INFO

Collect:
Lavender (EDTA), pink (K2EDTA) or serum separator tube. OR Amniotic fluid, CSF, ocular fluid or tissue.

Synonyms:

- T. gondii PCR
- Coccidia
- T gondi DNA detection
- Toxoplasma gondii, Molecular Detection, PCR
- LAB3866-VML
- LAB3866VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K2EDTA) or serum separator tube. OR Amniotic fluid, CSF, ocular fluid or tissue.

Specimen Preparation:
Separate serum or plasma from cells. Transfer 1 mL serum, plasma, amniotic fluid, CSF or ocular fluid to a sterile container. (Min: 0.5 mL) OR Tissue: Transfer to a sterile container and freeze immediately.

Unacceptable Conditions:
Heparinized specimens, tissues in optimal cutting temperature compound.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Tissue: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 3 months
All Others: Ambient: 8 hours; Refrigerated: 5 days; Frozen: 3 months

Performed:
Tue, Fri

Remarks:
Specimen source required.

ORDERING

Synonyms:

- T. gondii PCR
- Coccidia
- T gondi DNA detection
- Toxoplasma gondii, Molecular Detection, PCR
- LAB3866-VML
- LAB3866VML

Ordering Recommendations:
Confirm toxoplasmosis infection in immunocompromised hosts as well as fetuses and newborns. May be used to confirm equivocal antibody testing.

Performed:
Tue, Fri

Methodology:
Qualitative Polymerase Chain Reaction

Reported:
1-5 days

RESULTS INTERPRETATION

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Toxoplasma gondii IgG Antibody, ELISA (CSF)

LAB3183

ORDERING INFO

Collect:
CSF.

Synonyms:

- Toxoplasma gondii IgG
- LAB3183-VML
- LAB3183VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 0.5 mL CSF to an ARUP Standard Transport Tube. (Min: 0.25 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or Frozen.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Varies

ORDERING

Synonyms:

- Toxoplasma gondii IgG
- LAB3183-VML
- LAB3183VML

Ordering Recommendations:
Limited utility for routine clinical use. Serology has low sensitivity for detecting CNS toxoplasmosis.

Performed:
Varies

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay

Reported:
3-12 days

RESULTS INTERPRETATION

Reference Interval:

Section:
RF-ARUP

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:
CSF.

Specimen Preparation:
Transfer 0.5 mL CSF to an ARUP Standard Transport Tube. (Min: 0.25 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 month

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or Frozen.

Synonyms:

- Toxoplasma gondii IgG
- LAB3183-VML
- LAB3183VML

Performed:
Varies

Resulting Laboratory:
ARUP Laboratories

Reported:
3-12 days

Ordering Recommendations:
Limited utility for routine clinical use. Serology has low sensitivity for detecting CNS toxoplasmosis.

Reference Interval:
By report

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay

Section:
RF-ARUP

CPT Codes:
86777

Treponema pallidum Antibody by TP-PA

LAB3848

ORDERING INFO

Collect:
Serum separator tube or plasma separator tube.

Synonyms:

- MHA-TP
- Syphilis Antibody by MHA
- Syphilis TPPA
- T pallidum TPPA
- TP-PA
- Treponema Pallidum AB, Particle Agglutination
- T. pallidum Antibody by MHA
- Treponema pallidum Particle Agglutination Assay
- LAB3848-VML
- LAB3848VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plasma separator tube.

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.4 mL)

Unacceptable Conditions:
CSF or other body fluids.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Mon-Fri

ORDERING

Synonyms:

- MHA-TP
- Syphilis Antibody by MHA
- Syphilis TPPA
- T pallidum TPPA
- TP-PA
- Treponema Pallidum AB, Particle Agglutination
- T. pallidum Antibody by MHA
- Treponema pallidum Particle Agglutination Assay
- LAB3848-VML
- LAB3848VML

Ordering Recommendations:
CDC-recommended confirmatory test for syphilis. Order if initial screening (eg, RPR, VDRL) is reactive.

Performed:
Mon-Fri

Methodology:
Qualitative Particle Agglutination

Reported:
1-4 days

Notes:
TP-PA is a helpful diagnostic aid for the patient with a reactive reagin test, but presents with atypical signs of primary, secondary, or late syphilis. TP-PA compares favorably with the FTA test, but appears slightly less sensitive in cases of untreated early primary syphilis. In late syphilis, the agreement with FTA is 99%.

VDRL is the preferred test for cerebrospinal fluid. Treponemal tests (TP-PA or FTA) are not recommended for CSF. FTAs on CSF may be tested, but TP-PA cannot be tested on CSF.

RESULTS INTERPRETATION

Reference Interval:
Nonreactive

Methodology:
Qualitative Particle Agglutination

ADDITIONAL INFORMATION

Trypanosoma cruzi Antibody, IgG

LAB1260

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Chagas Antibody, IgG
- Tcruzi IgG Ab
- Trypanosoma cruzi Antibody, Total
- LAB1260-VML
- LAB1260VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days of the acute specimens. Mark specimens plainly as "acute" or "convalescent."

Unacceptable Conditions:
Plasma. Bacterially contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Wed

ORDERING

Synonyms:

- Chagas Antibody, IgG
- Tcruzi IgG Ab
- Trypanosoma cruzi Antibody, Total
- LAB1260-VML
- LAB1260VML

Ordering Recommendations:
Aid in the diagnosis of non-acute (chronic phase) Chagas disease (T. cruzi).

Performed:
Wed

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Trypanosoma cruzi Antibody, IgG	1.0 IV or less

Interpretive Data:

This assay should not be used for blood donor screening or associated re-entry protocols, or for screening Human Cell and Cellular Tissue-Based Products (HCT/Ps). According to the CDC, at least two different serologic tests should be used to make the laboratory diagnosis of chronic Chagas Disease, as no single serologic test is sufficiently sensitive and specific.

Component	Unit Of Measure	Interpretation
Trypanosoma cruzi Antibody, IgG	1.0 IV or less 1.1 IV 1.2 IV or greater	Negative - No significant level of Trypanosoma cruzi IgG antibody detected. Equivocal - Questionable presence of Trypanosoma cruzi IgG antibody detected. Repeat testing in 10-14 days may be helpful. Positive - IgG antibodies to Trypanosoma cruzi detected, which may suggest current or past infection.

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Yersinia enterocolitica Antibodies, IgA and IgG by Immunoblot

LAB1271

ORDERING INFO

Collect:
Serum separator tube (SST).

Synonyms:

- Y enterocolitica IgA, IgG Immunoblot
- Yersinia IgA & IgG by Immunoblot
- LAB1271-VML
- LAB1271VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, hemolyzed, icteric, lipemic, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Tue

ORDERING

Synonyms:

- Y enterocolitica IgA, IgG Immunoblot
- Yersinia IgA & IgG by Immunoblot
- LAB1271-VML
- LAB1271VML

Ordering Recommendations:
Immunoblot can be used as an adjunct tool in the diagnosis of Yersinia enterocolitica infection. The presence of IgA and IgG antibodies to Y. enterocolitica Yop proteins can also aid in the diagnosis of post-infectious autoimmune disorders associated with Y. enterocolitica (eg, reactive arthritis, erythema nodosum, Graves Disease, and Hashimoto thyroiditis).

Performed:
Tue

Methodology:
Qualitative Immunoblot

Reported:
1-8 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Yersinia enterocolitica, IgA Immunoblot	Negative
Yersinia enterocolitica, IgG Immunoblot	Negative

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

PML-RARA Detection by RT-PCR, Quantitative (Test on Referral as of 1/17/2023)

LAB6216

ORDERING INFO

Collect:
Whole blood or bone marrow in lavender (EDTA).

Synonyms:

- AMPL' APL
- APL MRD
- PML-RARA S, L, V forms
- PML-RARA long, short, variable types
- Quantitative PML
- PML-RARA fusion types, A, B, B variant
- APL Post-consolidation therapy testing
- t(15;17)
- PML_RARA fusion types
- t(15
- 17)
- LAB6216-VML
- LAB6216VML

SPECIMEN REQUIREMENTS

Collect:
Whole blood or bone marrow in lavender (EDTA).

Specimen Preparation:
Whole Blood: Transport 5 mL whole blood. (Min: 3 mL)
Bone Marrow: Transport 3 mL bone marrow. (Min: 1 mL)
Refrigerate immediately. Specimens must be received within 48 hours of collection due to lability of RNA.

Unacceptable Conditions:
Serum, plasma, ambient or frozen bone marrow, or whole blood, CSF, or FFPE tissue. Specimens collected in anticoagulants other than EDTA. Severely hemolyzed or clotted specimens.
Ambient whole blood and ambient bone marrow specimens past 7 days will be canceled. Refrigerated whole blood or bone marrow past 7 days will be canceled.

Storage/Transport Temperature:
Whole Blood and Bone Marrow: CRITICAL REFRIGERATED. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 48 hours; Frozen: Unacceptable

Performed:
Varies

Rickettsia typhi (Typhus Fever) Antibodies, IgG & IgM by IFA

LAB3853

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- Murine Typhus Antibodies
- R. typhi antibodies
- Typhus Fever Group Antibody, IgG and IgM, Serum
- LAB3853-VML
- LAB3853VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens.

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

Remarks:
Mark specimens plainly as "acute" or "convalescent."

ORDERING

Synonyms:

- Murine Typhus Antibodies
- R. typhi antibodies
- Typhus Fever Group Antibody, IgG and IgM, Serum
- LAB3853-VML
- LAB3853VML

Ordering Recommendations:
Confirm presence of Rickettsia typhi. Requires comparison of acute- to convalescent-phase serology.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Typhus Fever Antibody, IgG	Less than 1:64
Typhus Fever Antibody, IgM	Less than 1:64

Interpretive Data:

Component	Unit Of Measure	Interpretation
Typhus Fever Antibody, IgG	Less than 1:64 1:64-1:128 1:256 or greater	Negative - No significant level of IgG antibody detected. Equivocal - Questionable presence of IgG antibody detected. Repeat testing in 10-14 days may be helpful. Positive - Presence of IgG antibody detected, suggestive of current or past infection.
Typhus Fever Antibody, IgM	Less than 1:64 1:64 or greater	Negative - No significant level of IgM antibody detected. Positive - Presence of IgM antibody to detected, which may indicate a current or recent infection; however, low levels of IgM antibodies may occasionally persist for more than 12 months post-infection.

Methodology:
Semi-Quantitative Indirect Fluorescent Antibody (IFA)

ADDITIONAL INFORMATION

CPT Codes:
86757 x2

Section:
RF-ARUP

Remarks:
Mark specimens plainly as "acute" or "convalescent."

Resulting Laboratory:
ARUP Laboratories

FULL VIEW

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.4 mL) Parallel testing is preferred and convalescent specimens must be received within 30 days from receipt of the acute specimens.

Unacceptable Conditions:
Contaminated, hemolyzed, or severely lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- Murine Typhus Antibodies
- R. typhi antibodies
- Typhus Fever Group Antibody, IgG and IgM, Serum
- LAB3853-VML
- LAB3853VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-3 days

Ordering Recommendations:
Confirm presence of Rickettsia typhi. Requires comparison of acute- to convalescent-phase serology.

TPMT and *NUDT15*

LAB6002

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), or yellow (ACD solution A or B).

Synonyms:

- 6-TG
- 6-MP
- nudix
- 6-mercaptopurine
- 6-thioguanine
- AZA toxicity
- Azathioprine
- nucleoside diphosphate linked moiety X
- NUDT15 mutation
- S-adenosyl-L-methionine genotype
- Thioguanine
- Thiopurine
- Thiopurine S-methyltransferase genotype
- TPMT mutation
- TPMT genetics
- LAB6002-VML
- LAB6002VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), or yellow (ACD solution A or B).

Specimen Preparation:
Transport 3 mL whole blood. (Min: 1 mL)

Unacceptable Conditions:
Plasma or serum. Specimens collected in sodium heparin or lithium heparin. Frozen specimens in glass collection tubes.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 1 week; Frozen: 1 month

Performed:
Varies

ORDERING

- LAB6002-VML
- LAB6002VML

Ordering Recommendations:
Use this genotyping test to assess genetic risk for severe myelosuppression with standard dosing of thiopurine drugs in individuals for whom thiopurine therapy is being considered or who have had an adverse reaction to thiopurine therapy. This test may be performed irrespective of whether thiopurine therapy is currently being administered. For enzyme phenotyping prior to thiopurine treatment, refer to Thiopurine Methyltransferase, RBC (0092066). For thiopurine dosing optimization, refer to Thiopurine Metabolites in Red Blood Cells (3016503).

Performed:
Varies

Methodology:
Polymerase Chain Reaction (PCR)/Fluorescence Monitoring

Reported:
5-10 days

Notes:
Whole blood is the preferred specimen. Saliva samples that yield inadequate DNA quality and/or quantity will be reported as inconclusive if test performance does not meet laboratory-determined criteria for reporting.

RESULTS INTERPRETATION

Reference Interval:
By report

Interpretive Data:
Refer to report

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Methodology:
Polymerase Chain Reaction (PCR)/Fluorescence Monitoring

</table>

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Notes:

Allergens included in this panel: Alternaria alternata (tenuis), Aspergillus fumigatus, Bermuda Grass, Box Elder/Maple Tree, Cat Dander, Cockroach (German), Common Short Ragweed, Cottonwood Tree, D. farinae (mites), D. Pteronyssinus (mites), Dog Dander, Elm Tree, Hormodendrum (Cladosporium), Marsh Elder, Mouse Epithelium, Mountain Cedar (Juniper) Tree, Mucor racemosus, Oak Tree, Pecan (White Hickory) Tree, Penicillium notatum, Pigweed, Russian Thistle, Sycamore Tree, Timothy Grass, Walnut Tree, White Ash Tree, White Mulberry Tree, and IgE Serum Total.

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Serum Separator Tube (SST). Multiple specimen tubes should be avoided.

Specimen Preparation:

Separate from cells ASAP or within 2 hours of collection. Transfer 4 mL serum to an ARUP Standard Transport Tube. (Min: 1.4 mL)

Patient Preparation:

Multiple patient encounters should be avoided

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- LAB6019-VML
- LAB6019VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-3 days

Ordering Recommendations:

Allergen testing for patients in the central Midwest region (Illinois, Missouri, Iowa).

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Diuretic Screen, Urine

LAB3232

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Thiazide
- LAB3232-VML
- LAB3232VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 10 mL urine to ARUP Standard Transport Tubes. (Min: 1.2 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Frozen.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 2 weeks; Frozen: 6 months

Performed:
Varies

ORDERING

Synonyms:

- Thiazide
- LAB3232-VML
- LAB3232VML

Performed:
Varies

Methodology:
Qualitative High performance Liquid chromatography with ultraviolet detection (HPLC/UV)

Reported:
5-14 days

Notes:
Includes: benzthiazide, bumetanide, chlorothiazide, chlorthalidone, furosemide, hydrochlorothiazide, hydroflumethiazide, and metolazone.

RESULTS INTERPRETATION

Reference Interval:
By report

Methodology:
Qualitative High performance Liquid chromatography with ultraviolet detection (HPLC/UV)

Drug Profile, Targeted with Interpretation by Tandem Mass Spectrometry and Enzyme Immunoassay, Urine

LAB6100

ORDERING INFO

Collect:
Random urine.

Synonyms:

- addiction management
- Comprehensive hybrid
- high res
- hybrid
- medication adherence
- Pain management, (drug screen, targeted, urine)
- prenatal drug screen
- substance use disorder
- high-res
- medication compliance
- abstinence verification
- LAB6100-VML
- LAB6100VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Information on the patient's current medications must be submitted with the order. Include trade name, generic name, dosing frequency, and date of last dose, if known. Alternatively, please indicate if no prescription medication or drugs are being taken.

Collect:
Random urine.

Specimen Preparation:
Transfer 4 mL each into two (2) ARUP standard transport tubes of urine with no additives or preservatives. (Min: 2 mL each)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
Ambient: 1 week (Clonazepam may be unstable at ambient condition beyond three days); Refrigerated: 1 month; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- addiction management
- Comprehensive hybrid
- high res
- hybrid
- medication adherence
- Pain management, (drug screen, targeted, urine)
- prenatal drug screen
- substance use disorder
- high-res
- medication compliance
- abstinence verification
- LAB6100-VML
- LAB6100VML

Ordering Recommendations:

Qualitative test to monitor medication compliance and to detect undisclosed drug/substance use in support of pain management, substance use disorders treatment, and other pharmacotherapies involving controlled substances. Expert result interpretation is provided by a faculty clinical toxicologist.Submission of a medication history is required to optimize reporting; refer to ARUP's Medication Submission Guidelines for details. If a medication history is not available or interpretation is not desired, refer to Drug Profile, Targeted by Tandem Mass Spectrometry and Enzyme Immunoassay, Urine (2007479).This test does not distinguish between the delta-8 and delta-9 forms of THC or their metabolites.

Performed:

Sun-Sat

Methodology:

Quantitative Tandem Mass Spectrometry/Qualitative Enzyme Multiplied Immunoassay Technique (EMIT)/Quantitative Spectrophotometry

Reported:

1-4 days

Notes:

Creatinine concentration is also provided. The carisoprodol immunoassay has cross-reactivity to carisoprodol and meprobamate.

RESULTS INTERPRETATION

Reference Interval:

Drugs covered and range of cutoff concentrations. Note: Some drugs are identified based on the presence of unique drug metabolites not listed below.	
Drugs/Drug Classes	**Range of Cutoff Concentrations**
Barbiturates	200 ng/mL
Benzodiazepine-like: alprazolam, clonazepam, diazepam, lorazepam, midazolam, nordiazepam, oxazepam, temazepam, zolpidem	20 - 60 ng/mL
Cannabinoids (11-nor-9-carboxy-THC)	50 ng/mL
Ethyl Glucuronide	500 ng/mL
Muscle Relaxant(s): carisoprodol, meprobamate	100 ng/mL
Opiates/Opioids: buprenorphine, codeine, fentanyl, heroin, hydrocodone, hydromorphone, meperidine, methadone, morphine, naloxone, oxycodone, oxymorphone, tapentadol, tramadol	2-200 ng/mL
GABA analogues: Gabapentin, pregabalin	3,000 ng/mL
Phencyclidine (PCP)	25 ng/mL
Stimulants: amphetamine, cocaine, methamphetamine, methylphenidate, MDMA (Ecstasy), MDEA (Eve), MDA, phentermine	50-200 ng/mL

Interpretive Data:

Methodology: Qualitative Enzyme Immunoassay and Qualitative Liquid Chromatography-Tandem Mass Spectrometry, Quantitative Spectrophotometry

The absence of expected drug(s) and/or drug metabolite(s) may indicate non-compliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration must be greater than or equal to the cutoff concentration to be reported as present. If specific drug concentrations are required, contact the laboratory within two weeks of specimen collection to request confirmation and quantification by a second analytical technique. Interpretive questions should be directed to the laboratory.

Results based on immunoassay detection that do not match clinical expectations should be interpreted with caution. Confirmatory testing by mass spectrometry for immunoassay-based results is available if ordered within two weeks of specimen collection. Additional charges apply.

For medical purposes only; not valid for forensic use.

Francisella tularensis Antibodies, IgG and IgM with Reflex to Agglutination

LAB6161

ORDERING INFO

Collect:
Serum separator tube (SST) or Plain Red/Red-Top

Synonyms:

- F. tularensis IgG, IgM
- Febrile Antigens
- Francisella Antibodies
- Francisella Tularensis Ab
- LAB6161-VML
- LAB6161VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST) or Plain Red/Red-Top

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.6 mL)

Unacceptable Conditions:
Contaminated, heat-inactivated, or turbid specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- F. tularensis IgG, IgM
- Febrile Antigens
- Francisella Antibodies
- Francisella Tularensis Ab
- LAB6161-VML
- LAB6161VML

Ordering Recommendations:
Preferred test for detecting antibodies during acute or convalescent phase. Convalescent sera may be required for diagnosis.

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-6 days

Notes:
If the ELISA testing is equivocal or positive for IgG and/or IgM, then Francisella tularensis Antibodies by Agglutination will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Francisella tularensis Antibody, IgG	9 U/mL or less
Francisella tularensis Antibody, IgM	9 U/mL or less

Interpretive Data:

Cross- reactivity with Brucella and Yersinia antibodies may occur. Therefore, results should be interpreted with caution and correlated with clinical information. The best evidence for current infection is a significant change on two appropriately timed specimens, where both tests are performed in the same laboratory at the same time.

Component	Interpretation
Francisella tularensis Antibody, IgG	9 U/mL or less Negative - No significant level of IgG antibody to Francisella tularensis detected. 10-15 U/mL Equivocal - Questionable presence of IgG antibody to Francisella tularensis. Repeat testing in 10-14 days may be helpful. 16 U/mL or greater Positive - Presence of IgG antibody to Francisella tularensis detected, suggestive of current or past exposure/immunization.
Francisella tularensis Antibody, IgM	9 U/mL or less Negative - No significant level of IgM antibody to Francisella tularensis detected. 10-15 U/mL Equivocal - Questionable presence of IgM antibody to Francisella tularensis. Repeat testing in 10-14 days may be helpful. 16 U/mL or greater Positive - Presence of IgM antibody to Francisella tularensis detected, suggestive of current or recent exposure/immunization

Methodology:

Testosterone, Bioavailable and Total, Includes Sex Hormone-Binding Globulin (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy)

LAB3838

ORDERING INFO

Collect:
Serum separator tube or green (sodium or lithium heparin).

Synonyms:

- LAB3838-VML
- LAB3838VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect between 6-10 a.m.

Collect:
Serum separator tube or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.8 mL)

Unacceptable Conditions:
EDTA plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- LAB3838-VML
- LAB3838VML

Ordering Recommendations:
Provides a calculated value for bioavailable testosterone concentration using total testosterone measured by mass spectrometry. May be used to evaluate hyperandrogenism in children and cisgender females, monitor testosterone-suppressing hormone therapies (eg, antiandrogens or estrogens), evaluate testosterone status in individuals with protein-binding abnormalities, or evaluate hypogonadism in cisgender males.To compare this test to other testosterone tests, refer to the ARUP Testosterone Tests Comparison table.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry/Electrochemiluminescent Immunoassay/Calculation

Reported:
1-5 days

Notes:
The concentrations of free and bioavailable testosterone are derived from mathematical expressions based on constants for the binding of testosterone to albumin and/or sex hormone binding globulin.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval

Age	Male (ng/dL)	Female (ng/dL)

Tanner Stage V	11-71	23-165

Interpretive Data:

Bioavailable testosterone concentration is calculated using total testosterone (measured by mass spectrometry) and the binding constant of testosterone and sex hormone-binding globulin (SHBG) and/or albumin.

For individuals on testosterone-suppressing hormone therapies (e.g., antiandrogens or estrogens), refer to cisgender female reference intervals. For a complete set of all established reference intervals, refer to ltd.aruplab.com/Tests/Pub/0081057.

Methodology:

Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry/Electrochemiluminescent Immunoassay/Calculation

ADDITIONAL INFORMATION

CPT Codes:

84402; 84403; 84270

Section:

RF-ARUP

Notes:

The concentrations of free and bioavailable testosterone are derived from mathematical expressions based on constants for the binding of testosterone to albumin and/or sex hormone binding globulin.

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube or green (sodium or lithium heparin).

Specimen Preparation:

Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.8 mL)

Patient Preparation:

Collect between 6-10 a.m.

Unacceptable Conditions:

EDTA plasma.

Stability (from collection to initiation):

After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 6 months

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- LAB3838-VML
- LAB3838VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-5 days

Ordering Recommendations:
Provides a calculated value for bioavailable testosterone concentration using total testosterone measured by mass spectrometry. May be used to evaluate hyperandrogenism in children and cisgender females, monitor testosterone-suppressing hormone therapies (eg, antiandrogens or estrogens), evaluate testosterone status in individuals with protein-binding abnormalities, or evaluate hypogonadism in cisgender males.To compare this test to other testosterone tests, refer to the ARUP Testosterone Tests Comparison table.

Interpretive Data:
Bioavailable testosterone concentration is calculated using total testosterone (measured by mass spectrometry) and the binding constant of testosterone and sex hormone-binding globulin (SHBG) and/or albumin.

For individuals on testosterone-suppressing hormone therapies (e.g., antiandrogens or estrogens), refer to cisgender female reference intervals. For a complete set of all established reference intervals, refer to ltd.aruplab.com/Tests/Pub/0081057.

Testosterone, Free (Adult Males or Individuals on Testosterone Hormone Therapy)

LAB3837

ORDERING INFO

Collect:
Serum separator tube or green (lithium heparin).

Synonyms:

- Free testosterone
- serum testosterone free
- LAB3837-VML
- LAB3837VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect specimen between 6-10 a.m.

Collect:
Serum separator tube or green (lithium heparin).

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Unacceptable Conditions:
EDTA plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 1 week; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Free testosterone
- serum testosterone free
- LAB3837-VML
- LAB3837VML

Ordering Recommendations:
Provides a calculated value for free testosterone concentration using total testosterone measured by immunoassay. Use to evaluate hypogonadism in cisgender males with a total testosterone concentration at the lower limit of normal. May be used to evaluate testosterone status in individuals with protein-binding abnormalities or to monitor testosterone hormone therapies. Not recommended when low testosterone concentrations, such as those found in children and cisgender females, are expected. For these individuals, testing by mass spectrometry is recommended; refer to Testosterone, Free (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy) (0081059).To compare this test to other testosterone tests, refer to the ARUP Testosterone Tests Comparison table.

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay/Calculation

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Male:
14-15 years: 3-138 pg/mL
16-17 years: 38-173 pg/mL
18 years and older: 47-244 pg/mL

Tanner Stage IV: 35-169 pg/mL
Tanner Stage V: 41-239 pg/mL

Interpretive Data:

Free testosterone concentration is calculated using total testosterone (measured by immunoassay) and the binding constant of testosterone and sex hormone-binding globulin (SHBG). Testosterone immunoassays are both imprecise and inaccurate at low testosterone concentrations, such as those found in children and cisgender females. For these individuals, testing by mass spectrometry is recommended; refer to Testosterone, Free (Adult Females, Children, or Individuals on Testosterone-Suppressing Hormone Therapy) (ARUP test code 0081059).

For individuals on testosterone hormone therapy, refer to cisgender male reference intervals. No reference intervals have been established for males younger than 14 years or for cisgender females. For a complete set of all established reference intervals, refer to ltd.aruplab.com/Tests/Pub/0070111.

Methodology:

Quantitative Electrochemiluminescent Immunoassay/Calculation

17-Hydroxycorticosteroids, Urine

LAB351

ORDERING INFO

Collect:
24-hour urine. Refrigerated during collection. Also acceptable: Random urine. Freeze within 15 minutes of collection, preservative not required. Reported as mg/L, no reference interval provided.

Synonyms:

- Urinary Free Cortisol
- Free Urinary Cortisol
- 17-Hydroxycorticosteroids
- 17-Ketogenic Steroid
- Cortisol Free Urine
- LAB351-VML
- LAB351VML

SPECIMEN REQUIREMENTS

Collect:
24-hour urine. Refrigerated during collection. Also acceptable: Random urine. Freeze within 15 minutes of collection, preservative not required. Reported as mg/L, no reference interval provided.

Specimen Preparation:
Transfer 12 mL aliquot of urine from a well-mixed 24-hour collection to ARUP Standard Transport Tubes. Also acceptable: Specimens refrigerated with preservatives are acceptable. Sample pH must be 5.0 - 7.0. Mix well, add 1 g boric acid/100 mL urine, adjust pH (with boric acid) to 5.0-7.0 and freeze. Record total volume, collection time, and pH on transport tube and test request form. Random specimens without preservative are acceptable if frozen within 15 minutes of collection.

Unacceptable Conditions:
Alkali preservatives (e.g. specimens previously preserved with NaOH).

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 4 hours (with preservative); Refrigerated: 1 week (with preservative); Frozen: 1 month

Performed:
Wed, Sat

ORDERING

Synonyms:

- Urinary Free Cortisol
- Free Urinary Cortisol
- 17-Hydroxycorticosteroids
- 17-Ketogenic Steroid
- Cortisol Free Urine
- LAB351-VML
- LAB351VML

Performed:
Wed, Sat

Methodology:
Quantitative Colorimetry

Reported:
3-7 days

RESULTS INTERPRETATION

Reference Interval:

<table>
<tr><th>Components</th><th>Reference Interval</th></tr>
<tr><td>Creatinine, Urine - per 24h</td><td>
<table>
<tr><th>Age</th><th>Male (mg/d)</th><th>Female (mg/d)</th></tr>
<tr><td>3-8 years</td><td>140-700</td><td>140-700</td></tr>
<tr><td>9-12 years</td><td>300-1300</td><td>300-1300</td></tr>
<tr><td>13-17 years</td><td>500-2300</td><td>400-1600</td></tr>
<tr><td>18-50 years</td><td>1000-2500</td><td>700-1600</td></tr>
<tr><td>51-80 years</td><td>800-2100</td><td>500-1400</td></tr>
<tr><td>81 years and older</td><td>600-2000</td><td>400-1300</td></tr>

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube (SST). Also acceptable: Plain red, pink (K2EDTA), plasma separator tube (PST), green (sodium heparin), or green (lithium heparin).

Specimen Preparation:

Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.3 mL)

Unacceptable Conditions:

Grossly hemolyzed specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 3 Days; Refrigerated: 1 week; Frozen: 6 months

Storage/Transport Temperature:

Frozen. Also acceptable: Refrigerated.

Synonyms:

- 17-OHP
- 17a
- 17a-OH
- Hydroxyprogesterone
- Progesterone
- LAB6204-VML

17-Ketosteroids, Urine

LAB350

ORDERING INFO

Collect:
24-hour urine. Refrigerate during collection.

Synonyms:

- LAB350-VML
- LAB350VML

SPECIMEN REQUIREMENTS

Collect:
24-hour urine. Refrigerate during collection.

Specimen Preparation:
Transfer two 4 mL aliquots from a well-mixed 24-hour urine collection into 2 ARUP Standard Transport Tubes or 2 ARUP Standard Transport Tubes containing 20 mg Sulfamic Acid (ARUP supply #48098) available online through eSupply using ARUP Connect(TM) or by contacting ARUP Client Services at (800) 522-2787. (Min: 3 mL/aliquot) Adequate refrigeration is the most important aspect of specimen preservation.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 4 hours; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Mon, Wed, Fri

Remarks:
Record total volume and collection time interval on transport tube and test request form.

ORDERING

Synonyms:

- LAB350-VML
- LAB350VML

Ordering Recommendations:
Assess adrenal androgen production. Preferred test is Dehydroepiandrosterone Sulfate, Serum (0070040).

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Spectrophotometry

Reported:
1-5 days

Notes:
An alternative and more specific test for adrenal androgen function is Dehydroepiandrosterone Sulfate, Serum (ARUP test code 0070040).

A large number of substances may interfere with this test. Decreases may be caused by carbamazepine, cephaloridine, cephalothin, chlormerodrin, digoxin, glucose, metyrapone, promazine, propoxyphene, reserpine, and others. Increases may be caused by acetone, acetophenide, ascorbic acid, chloramphenicol, chlorothiazide, chlorpromazine, cloxacillin, dexamethasone, erythromycin, ethinamate, etryptamine, methicillin, methyprylon, morphine, oleandomycin, oxacillin, penicillin, phenaglycodol, phenazopyridine, phenothiazine, piperidine, quinidine, secobarbital, spironolactone, and others.

</td></tr>
<tr><td>Creatinine, Urine - per volume</td><td></td></tr>
</table>

Interpretive Data:

Reference intervals for random urine samples (mg/L) are not available.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

Methodology:

Quantitative Spectrophotometry

21-Hydroxylase Autoantibodies, Serum

LAB6090

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plain Red.

Synonyms:

- Anti-Adrenal Antibody
- Hydroxylase Antibody
- Adrenal Antibody
- Adrenal Antibodies
- 21-OH Ab
- LAB6090-VML
- LAB6090VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plain Red.

Specimen Preparation:
Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 1 week; Frozen: 1 month

Performed:
Tue, Fri

ORDERING

Synonyms:

- Anti-Adrenal Antibody
- Hydroxylase Antibody
- Adrenal Antibody
- Adrenal Antibodies
- 21-OH Ab
- LAB6090-VML
- LAB6090VML

Ordering Recommendations:
Secondary test to diagnose autoimmune disease after adrenal insufficiency confirmed.

Performed:
Tue, Fri

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay

Reported:
2-7 days

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The 21-Hydroxylase Autoantibody assay is intended for the qualitative determination of autoantibodies to steroid 21-hydroxylase in human serum.
A positive result is indicative of primary adrenal insufficiency (Addison disease). Results should be interpreted within the context of clinical symptoms, including functional adrenal testing.
Males with adrenal insufficiency and negative results for 21-hydroxylase autoantibodies should be screened for X-Linked Adrenoleukodystrophy (X-ALD) by ordering Very Long-Chain Branched Fatty Acids in Plasma (ARUP Test Code 2004250).

Methodology:
Qualitative Enzyme-Linked Immunosorbent Assay

5-Hydroxyindoleacetic Acid (HIAA), Urine

LAB352

ORDERING INFO

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Synonyms:

- Serotonin Metabolite
- 5-HIAA
- 5-OH-Indoleacetic Acid
- Hydroxyindoleacetic Acid
- LAB352-VML
- LAB352VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patients should abstain, if possible, from medications, over-the-counter drugs, and herbal remedies for at least 72 hours prior to the test. Foods rich in serotonin (avocados, bananas, eggplant, pineapple, plums, tomatoes, walnuts) and medications that may affect metabolism of serotonin must be avoided at least 72 hours before and during collection of urine for HIAA.

Collect:
24-hour or random urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:
Transfer 4 mL aliquot from a well-mixed 24-hour or random collection to an ARUP Standard Transport Tube. (Min: 1 mL) Record total volume and collection time interval on transport tube and test request form.

Unacceptable Conditions:
Any sample except urine.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 2 months

Performed:
Sun-Sat

Remarks:
Please see Note for a more comprehensive list of dietary restrictions.

ORDERING

Synonyms:

- Serotonin Metabolite
- 5-HIAA
- 5-OH-Indoleacetic Acid
- Hydroxyindoleacetic Acid
- LAB352-VML
- LAB352VML

Ordering Recommendations:
Use to diagnose carcinoid tumors and monitor disease.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography -Tandem Mass Spectrometry

Reported:
1-5 days

Notes:

Foods and medications associated with altered urinary HIAA results:

Decreased HIAA: Aspirin, chlorpromazine (Thorazine), corticotropin, dihydroxyphenylacetic acid, alcohol, gentisic acid, homogentisic acid, hydrazine derivatives, imipramine (Tofranil®), isocarboxazid (Marplan), keto acids, levodopa, MAO inhibitors, methenamine, methyldopa (Aldomet®), perchlorperazine, phenothiazines (Compazine®), promazine, promethazine (Mepergan®).

Increased HIAA: Acetaminophen, acetanilide, caffeine, coumaric acid, diazepam (Valium®), ephedrine, fluorouracil, glycerol guaiacolate (Guaifenesin), melphalan (Alkeran®), mephenesin, methamphetamine (Desoxyn), methocarbamol (Robaxin®), naproxen, nicotine, phenacetin, phenmetrazine, phenobarbital, phentolamine, rauwolfia, reserpine.

</table>
</td></tr>
</table>

Interpretive Data:

5-Hydroxyindoleacetic acid (5-HIAA) results are expressed as a ratio to creatinine excretion (mg/g CRT). No reference interval is available for results reported in units of mg/L. Increased urine 5-HIAA concentration is common and may be the result of improper specimen collection, consumption of serotonin containing foods or dietary supplements, drug interference, or malabsorption syndromes. Significant elevation (ten times the upper reference limit) of urine 5-HIAA may indicate the presence of a carcinoid tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative High Performance Liquid Chromatography -Tandem Mass Spectrometry

ADDITIONAL INFORMATION

CPT Codes:

83497

Section:

RF-ARUP

Remarks:

Please see Note for a more comprehensive list of dietary restrictions.

Notes:

Foods and medications associated with altered urinary HIAA results:

Decreased HIAA: Aspirin, chlorpromazine (Thorazine), corticotropin, dihydroxyphenylacetic acid, alcohol, gentisic acid, homogentisic acid, hydrazine derivatives, imipramine (Tofranil®), isocarboxazid (Marplan), keto acids, levodopa, MAO inhibitors, methenamine, methyldopa (Aldomet®), perchlorperazine, phenothiazines (Compazine®), promazine, promethazine (Mepergan®).

Increased HIAA: Acetaminophen, acetanilide, caffeine, coumaric acid, diazepam (Valium®), ephedrine, fluorouracil, glycerol guaiacolate (Guaifenesin), melphalan (Alkeran®), mephenesin, methamphetamine (Desoxyn), methocarbamol (Robaxin®), naproxen, nicotine, phenacetin, phenmetrazine, phenobarbital, phentolamine, rauwolfia, reserpine.

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

24-hour or random urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:

Transfer 4 mL aliquot from a well-mixed 24-hour or random collection to an ARUP Standard Transport Tube. (Min: 1 mL) Record total volume and collection time interval on transport tube and test request form.

Patient Preparation:

Patients should abstain, if possible, from medications, over-the-counter drugs, and herbal remedies for at least 72 hours prior to the test. Foods rich in serotonin (avocados, bananas, eggplant, pineapple, plums, tomatoes, walnuts) and medications that may affect metabolism of serotonin must be avoided at least 72 hours before and during collection of urine for HIAA.

Unacceptable Conditions:

Any sample except urine.

Stability (from collection to initiation):

Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 2 months

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- Serotonin Metabolite
- 5-HIAA
- 5-OH-Indoleacetic Acid
- Hydroxyindoleacetic Acid
- LAB352-VML
- LAB352VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-5 days

Ordering Recommendations:

Use to diagnose carcinoid tumors and monitor disease.

Interpretive Data:

5-Hydroxyindoleacetic acid (5-HIAA) results are expressed as a ratio to creatinine excretion (mg/g CRT). No reference interval is available for results reported in units of mg/L. Increased urine 5-HIAA concentration is common and may be the result of improper specimen collection, consumption of serotonin containing foods or dietary supplements, drug interference, or malabsorption syndromes. Significant elevation (ten times the upper reference limit) of urine 5-HIAA may indicate the presence of a carcinoid tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Abnormal PT/PTT Evaluation

LAB3442

ORDERING INFO

Collect:

Four 2.7 mL Light Blue Tubes (3.2% Sodium Citrate)

Synonyms:

- LAB3442, ACI, Prolonged PT Evaluation, Prolonged PTT Evaluation, Coagulation Interpretation
- LAB3442-VML
- LAB3442VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:
Four 2.7 mL Light Blue Tubes (3.2% Sodium Citrate)

Specimen Preparation:
Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, double centrifugation is required. Transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:
Pediatric: Two 2.7 mL Light blue tubes (3.2% Sodium Citrate); Neonatal: Three 1.8mL Light blue tubes (3.2% Sodium Citrate)

Storage/Transport Temperature:
Ambient: (15-25°C) for Light Blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:
Monday - Friday

Stability:
Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:
Citrated platelet poor plasma.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
N/A

Synonyms:

- LAB3442, ACI, Prolonged PT Evaluation, Prolonged PTT Evaluation, Coagulation Interpretation
- LAB3442-VML
- LAB3442VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 days

Methodology:
Clotting/ Chromogenic

Components:
PT/INR, PTT, Thrombin Time, LMWH assay. As indicated by initial testing: PT/PTT Mixing Study, DRVVT Screen & Confirm, Specific Factor Activity & Inhibitors, FBG, Reptilase Time, Pre Kallikrein Screen, HMW Kininogen Screen, and Interpretive Report. Additional tests as indicated by test results.

RESULTS INTERPRETATION

Reference Interval:
See Individual tests

Interpretive Data:
Direct thrombin (IIa) inhibitors and both direct and indirect Xa inhibitors may interfere with the assay. The presence of a strong lupus anticoagulant may interfere with the assay. Theraputic levels of warfarin may affect the test results.

Methodology:
Clotting/ Chromogenic

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Testing is performed from 7:00AM to 4:00PM. Samples must be received in the lab by 12:00PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call. (Refer to Synergy for contact information.)

Components:
PT/INR, PTT, Thrombin Time, LMWH assay. As indicated by initial testing: PT/PTT Mixing Study, DRVVT Screen & Confirm, Specific Factor Activity & Inhibitors, FBG, Reptilase Time, Pre Kallikrein Screen, HMW Kininogen Screen, and Interpretive Report. Additional tests as indicated by test results.

Resulting Laboratory:

Acetylcholine Receptor Binding Antibody

LAB836

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- AChR Antibody
- Muscle nicotinic Acetylcholine Receptor (AChR) Binding Antibody
- Myasthenia Gravis Antibodies
- LAB836-VML
- LAB836VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Plasma. Contaminated, hemolyzed, or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- AChR Antibody
- Muscle nicotinic Acetylcholine Receptor (AChR) Binding Antibody
- Myasthenia Gravis Antibodies
- LAB836-VML
- LAB836VML

Ordering Recommendations:
Initial diagnostic testing for myasthenia gravis. For reflexive panel, which contains binding, blocking, and modulating antibodies, refer to Acetylcholine Receptor Antibody Reflexive Panel (2001571).

Performed:
Sun-Sat

Methodology:
Quantitative Radioimmunoassay

Reported:
2-3 days

RESULTS INTERPRETATION

Components	Reference Interval
Acetylcholine Binding Antibody	0.4 nmol/L or less

Interpretive Data:

Approximately 85-90% of patients with myasthenia gravis (MG) express antibodies to the acetylcholine receptor (AChR), which can be divided into binding, blocking, and modulating antibodies. Binding antibody can activate complement and lead to loss of AChR. Blocking antibody may impair binding of acetylcholine to the receptor, leading to poor muscle contraction. Modulating antibody causes receptor endocytosis resulting in loss of AChR expression, which correlates most closely with clinical severity of disease. Approximately 10-15% of individuals with confirmed myasthenia gravis have no measurable binding, blocking, or modulating antibodies.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Component	Interpretation
Acetylcholine Receptor Binding Antibody	0.0-0.4 nmol/L Negative 0.5 nmol/L or greater Positive

Methodology:

Quantitative Radioimmunoassay

Acid-fast Bacillus Culture with Stain

LAB877

ORDERING INFO

Collect:

Sterile screwtop container

Synonyms:

- AFB, Mycobacterium, culture, ABA
- LAB877-VML
- LAB877VML

Turn Around Time:

AFB smear: 24 hours. Culture: 6 weeks for negative culture. Positive growth reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Sterile screwtop container

Specimen Preparation:

Place each specimen into 50 ml sterile specimen transport tube and place in an individually sealed bag. Respiratory Specimens: Transfer (for each collection) 5-10 mL to a sterile container. (Min: 1 mL) Body Fluids: Transfer 5 mL to a sterile container. (Min: 1 mL culture only) CSF: Transfer 5 mL to a sterile container. (Min: 1 mL culture only. Min: 5 mL culture and stain) Gastric Aspirates: Must be neutralized (pH7) with sodium carbonate if transport is delayed for more than four hours. Transfer 5-10 mL to a sterile container. (Min: 1 mL) Tissue: Transfer to a sterile container. (Min: Visible, for small tissue that cannot be ground, acid fast stain will not be performed.) Urine: Transfer at least 40 mL to a sterile container. (Min: 10 mL culture only. Min: 40 mL culture and stain)

ADAMTS-13 Panel

LAB3443

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB3443, ADA, ADAMTS-13 Activity, ADAMTS-13 Inhibitor, Coagulation Interpretation
- LAB3443-VML
- LAB3443VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

- LAB3443VML

Performed:
Daily

Turn Around Time:
1 - 3 days

Methodology:
FRET- Fluorescence Resonance Energy Transfer

Components:
ADAMTS-13 ACTIVITY, if indicated ADAMTS-13 INHIBITOR, COAGULATION INTERPRETATION

RESULTS INTERPRETATION

Reference Interval:
ADAMTS-13 ACTIVITY > 60%, ADAMTS-13 INHIBITOR - NOT PRESENT

Interpretive Data:
Refer to report. This test was developed and its performance characteristics determined by Vanderbilt Medical Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
FRET- Fluorescence Resonance Energy Transfer

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Testing is performed from 7:00AM to 4:00PM. Samples must be received in the lab by 1:00PM for same day testing. After hours testing must be approved by the Coagulation Medical Director on-call (refer to Synergy for contact information).

Components:
ADAMTS-13 ACTIVITY, if indicated ADAMTS-13 INHIBITOR, COAGULATION INTERPRETATION

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Adenosine Deaminase in CSF

LAB3158

ORDERING INFO

Collect:
Cerebrospinal Fluid.

Synonyms:

- ADA
- LAB3158-VML
- LAB3158VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Collect specimens in leak-proof container.

Collect:
Cerebrospinal Fluid.

Specimen Preparation:
Centrifuge specimen at room temperature. Transfer 0.5 mL fluid (supernatant) to an ARUP Standard Transport Tube and freeze. (Min: 0.2 mL)

Unacceptable Conditions:
Whole blood. Bronchoalveolar lavage (BAL) specimens. Turbid specimens.

Storage/Transport Temperature:
Frozen. Specimen must remain frozen until received in lab.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 1 week; Frozen: 1 month

Performed:
Sun, Tue, Thu

Remarks:
Indicate source on requisition.

ORDERING

Adenosine Deaminase, RBC

LAB3500

ORDERING INFO

Collect:
Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Synonyms:

- ADA
- LAB3500-VML
- LAB3500VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K_2EDTA), or green (sodium or lithium heparin).

Specimen Preparation:
Do not freeze. Transport 1 mL whole blood.

Unacceptable Conditions:
Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 15 days; Refrigerated: 15 days; Frozen: Unacceptable

Performed:
Sun, Tue, Thu

ORDERING

Synonyms:

- ADA
- LAB3500-VML
- LAB3500VML

Ordering Recommendations:
May be used as a marker of severe combined immunodeficiency (SCID); lack of adenosine deaminase (ADA) allows deoxyadenosine to accumulate and kill lymphocytes.

Performed:
Sun, Tue, Thu

Methodology:
Kinetic Spectrophotometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 20, 2012

400-900 mU/g Hb

Interpretive Data:
Adenosine Deaminase (ADA) deficiency is an autosomal recessive disorder of purine metabolism primarily affecting lymphocyte development, viability, and function. Affected individuals have less than 1 percent of normal ADA catalytic activity in red cell hemolysates. ADA deficiency is the cause of 20-30 percent of SCID cases. If the patient has been recently transfused, ADA deficiency may be masked; interpret results with caution. Heterozygotes cannot be identified by this test.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Kinetic Spectrophotometry

Alanine Aminotransferase (ALT), Plasma

LAB132

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- SGPT, ALT, Alanine transaminase, LAB132
- LAB132-VML
- LAB132VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma from cells ASAP or within 2 hours of collection. (Min 0.2 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 3 days; 2° to 8°C: 7 days; Frozen: 7 days

Specimen:
Plasma

Alternate Specimen:
N/A (Serum for Roche Not approved)

Aldolase, Serum

LAB556

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- aldolase
- Aldolase, S
- Fructose-Biphosphate Aldolase
- Total Aldolase
- LAB556-VML
- LAB556VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Allow specimen to clot completely at room temperature. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimen types other than serum. Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 5 days; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- aldolase
- Aldolase, S
- Fructose-Biphosphate Aldolase
- Total Aldolase
- LAB556-VML
- LAB556VML

Ordering Recommendations:
Do not use as a stand-alone test. This non-specific test has been replaced by more specific markers for muscle or liver damage. It has largely been replaced by other enzyme tests such as CK, alanine aminotransferase (ALT), and aspartate aminotransferase (AST) as markers of muscle or liver damage.

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

0-30 days	6.0-32.0 U/L
1-5 months	3.0-12.0 U/L
6-35 months	3.5-10.0 U/L
3-6 years	2.7-8.8 U/L
7-17 years	3.3-9.7 U/L
18 years and older	1.2-7.6 U/L

Aldosterone and Direct Renin with Ratio, plasma

LAB5713

ORDERING INFO

Collect:

Two lavender tubes (EDTA)

Synonyms:

- LAB5713, ARR, Aldosterone/Renin Ratio, Aldosterone/Plasma Renin Ratio
- LAB5713-VML
- LAB5713VML

Turn Around Time:

1 week

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Two lavender tubes (EDTA)

Specimen Preparation:

Collect, process, and centrifuge at ambient temperature. Do not refrigerate. Plasma should be transferred into an aliquot tube and stored frozen until ready for testing. (Minumum: 0.5 mL plasma)

Pediatric Collection:

Four lavender microtainers (EDTA)

Storage/Transport Temperature:

Frozen (-20°C)

Performed:

Tuesday and Friday

Stability:

After separation from cells: Ambient (15-25°C): 72 hours Frozen (-20°C): 56 days

Specimen:

Plasma

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

This panel is used in the initial screening of pateints for hypertension due to primary hyperaldosteronism.

Synonyms:

- LAB5713, ARR, Aldosterone/Renin Ratio, Aldosterone/Plasma Renin Ratio
- LAB5713-VML
- LAB5713VML

Performed:
Tuesday and Friday

Turn Around Time:
1 week

Methodology:
Chemiluminescent Immunoassay

Components:
Aldosterone, Direct Renin/Renin Mass, Aldosterone/Renin Ratio

RESULTS INTERPRETATION

Reference Interval:
The Endocrine Society guidelines suggest an ARR =/> 5.7 is consistent with primary hyperaldosteronism. Internal studies by the Vanderbilt Medical Laboratories Special Chemistry laboratory have shown that an ARR =/> 2.6 may be associated with hyperaldosteronism.

Interpretive Data:
Normal serum levels of aldosterone are dependent on the sodium intake and whether the patient is upright or supine. High sodium intake will tend to suppress serum aldosterone, whereas low sodium intake will elevate serum aldosterone. The reference intervals for serum aldosterone are based on normal sodium intake.

Methodology:
Chemiluminescent Immunoassay

ADDITIONAL INFORMATION

Section:
Special Chemistry

Alternate Specimen:
N/A

Additional Information:
Primarily used in conjunction for primary hyperaldosteronism.

Plasma

Reasons for Rejection:
Improper handling, frozen sample before spun down, QNS, grossly hemolyzed, grossly lipemic

Components:
N/A

Stability:
After separation from cells: Ambient (15-25°C): 8 hours Refrigerated (2-8°C): 5 days Frozen (-20°C): 1 month

Storage/Transport Temperature:
Frozen (-20°C)

Synonyms:

- LAB557, ALD
- LAB557-VML
- LAB557VML

Performed:
Tuesday and Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 week

Ordering Indicators:
This test is used in conjunction with renin as a screen for primary and secondary hyperaldosteronism (aldosterone/renin mass ratio) and hypoaldosteronism.

Interpretive Data:
Normal serum levels of aldosterone are dependent on the sodium intake and whether the patient is upright or supine. High sodium intake will tend to suppress serum aldosterone, whereas low sodium intake will elevate serum aldosterone. The reference intervals for serum aldosterone are based on normal sodium intake.

Reference Interval:
Supine: < 23.6 ng/dL Upright: < 35.3 ng/dL

Additional Information:
N/A

Methodology:
Chemiluminescent Immunoassay

Section:
Special Chemistry

Aldosterone, Urine

LAB6183

ORDERING INFO

Collect:
24-hour urine. Urine must be refrigerated during collection.

Synonyms:

- 24 hr aldosterone
- urine aldosterone
- LAB6183-VML
- LAB6183VML

SPECIMEN REQUIREMENTS

Collect:
24-hour urine. Urine must be refrigerated during collection.

Specimen Preparation:
Add 1 g boric acid per 100 mL urine. Transfer 4 mL aliquot of urine from a 24-hour collection to an ARUP Standard Transport Tube. (Min: 0.5 mL) Record total volume and collection time interval on transport tube and test request form. Also acceptable: Preserved urine if the pH of the specimen is adjusted to 2-4 with 6M HCl or 50 percent acetic acid or unpreserved urine if frozen immediately after collection.

Storage/Transport Temperature:
Frozen. Also acceptable: Refrigerated, if preserved with HCl or acetic acid.

Stability (from collection to initiation):
Ambient: 4 hours; Refrigerated: (with preservative): 5 days; Frozen: 1 month

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- 24 hr aldosterone
- urine aldosterone
- LAB6183-VML
- LAB6183VML

Ordering Recommendations:
Screen and diagnose hyperaldosteronism.

Performed:
Tue, Thu, Sat

Methodology:
Quantitative Chemiluminescent Immunoassay (CLIA)

Reported:
2-5 days

RESULTS INTERPRETATION

Reference Interval:

Effective October 6, 2014

Components	Reference Interval
Aldosterone, Urine	1.2-28.1 µg/d
Creatinine, Urine - per 24h	

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

Methodology:

Quantitative Chemiluminescent Immunoassay (CLIA)

Alkaline Phosphatase Isoenzymes, Serum or Plasma

LAB741

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Green (Sodium or Lithium Heparin).

Synonyms:

- ALK PHOS
- Alkaline Phosphatase
- Alkaline Phosphatase Isoenzymes by Heat Fractionation
- Alkp
- LAB741-VML
- LAB741VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Green (Sodium or Lithium Heparin).

Specimen Preparation:
Allow serum specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum or plasma to an ARUP Standard Transport Tube and refrigerate or freeze immediately. (Min: 1 mL)

Unacceptable Conditions:
Specimens collected in EDTA, sodium fluoride, sodium citrate, or potassium oxalate. Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 1 week; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- ALK PHOS
- Alkaline Phosphatase
- Alkaline Phosphatase Isoenzymes by Heat Fractionation
- Alkp
- LAB741-VML
- LAB741VML

Ordering Recommendations:
Use when total alkaline phosphatase activity is elevated to determine amounts contributed by bone and liver isoenzymes.

Performed:
Sun-Sat

Methodology:
Quantitative Heat Inactivation/Enzymatic Assay

Reported:
1-4 days

Notes:
The presence of heat-stable isoenzymes (i.e., germ cell and placental) will be detected but their activities cannot be differentiated from the liver isoenzyme.

RESULTS INTERPRETATION

Reference Interval:

Components		
Alkaline Phosphatase, Serum or Plasma	Male 0-30 days: 60-320 U/L 1-11 months: 70-350 U/L 1-3 years: 125-320 U/L 4-6 years: 150-370 U/L 7-9 years: 150-440 U/L 10-11 years: 150-470 U/L 12-13 years: 160-500 U/L 14-15 years: 130-530 U/L 16-19 years: 60-270 U/L 20 years and older: 40-120 U/L	Female 0-30 days: 60-320 U/L 1-11 months: 70-350 U/L 1-3 years: 125-320 U/L 4-6 years: 150-370 U/L 7-9 years: 150-440 U/L 10-11 years: 150-530 U/L 12-13 years: 110-525 U/L 14-15 years: 55-305 U/L 16-19 years: 40-120 U/L 20 years and older: 40-120 U/L

- ImmunoCAP c6
- Amoxicilloyl
- LAB3516-VML
- LAB3516VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- Felis domesticus Dander
- ImmunoCAP e1
- LAB3503-VML

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- Budgie Feathers
- ImmunoCAP e78
- Melopsittacus undulatus Feathers
- Parrot
- LAB3513-VML
- LAB3513VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-3 days

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- M. domestica (Allergen, Food, Apple)
- ImmunoCAP f49 (Allergen, Food, Apple)
- M. communis (Allergen, Food, Apple)
- Crabapple (Allergen, Food, Apple)
- Cultivated apple (Allergen, Food, Apple)
- M. pumila (Allergen, Food, Apple)
- M. sylvestris (Allergen, Food, Apple)
- Malus x domestica (Allergen, Food, Apple)
- LAB3520-VML
- LAB3520VML

Performed:

Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-3 days

Interpretive Data:
Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reference Interval:
Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- ImmunoCAP f6
- Barleycorn
- Hordeum vulgare
- LAB3526-VML
- LAB3526VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-3 days

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- Bertholletia excelsa (Allergen, Food, Brazil Nut)
- Cream Nut (Allergen, Food, Brazil Nut)

0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- ImmunoCAP f369
- Ictalurus punctatus
- LAB3538-VML
- LAB3538VML

Performed:

Sun-Sat

Resulting Laboratory:

Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Russian Parsley
- Swedish Parsley
- Anethum graveolens
- Bastard Fennel
- False Anise
- ImmunoCAP F277
- Peucedanum graveolens
- LAB3558-VML
- LAB3558VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of laboratory allergen results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Cultivated Garlic (Allergen, Food, Garlic)
- ImmunoCAP f47 (Allergen, Food, Garlic)
- Poor Man's Treacle (Allergen, Food, Garlic)
- Allium sativum (Allergen, Food, Garlic)
- LAB3565-VML
- LAB3565VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

- String Bean (Allergen, Food, Green Bean (String))
- LAB3570-VML
- LAB3570VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-3 days

Interpretive Data:
Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Reference Interval:
Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Allergen, Food, Guar Gum IgE

LAB3571

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Cyamopsis psoraloides (Allergen, Food, Gum Guar IgE)
- Cyamopsis tetragonoloba (Allergen, Food, Gum Guar IgE)
- Cyamposis tetragonolobus (Allergen, Food, Gum Guar IgE)
- LAB3571-VML
- LAB3571VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ARUP Laboratories

FULL VIEW

Collect:

Serum separator tube.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- A. chinensis deliciosa
- A. latifolia var. deliciosa
- Kiwifruit
- Monkey Peach
- Sheep Peach
- Actinidia deliciosa
- Chinese Gooseberry
- ImmunoCAP f84
- LAB3576-VML
- LAB3576VML

Performed:

Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-3 days

Interpretive Data:
Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reference Interval:
Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Synonyms:

- H. americanus - American Lobster (Allergen, Food, Lobster)
- Homarus gammarus - European Lobster (Allergen, Food, Lobster)
- ImmunoCAP f80 (Allergen, Food, Lobster)
- LAB3582-VML
- LAB3582VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- H. americanus - American Lobster (Allergen, Food, Lobster)
- Homarus gammarus - European Lobster (Allergen, Food, Lobster)
- ImmunoCAP f80 (Allergen, Food, Lobster)
- LAB3582-VML
- LAB3582VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Allergen, Food, Mustard

LAB3588

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Black Mustard
- Brassica/Sinapsis spp.
- Brown Mustard
- ImmunoCAP f89
- White Mustard
- Yellow Mustard
- LAB3588-VML
- LAB3588VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Black Mustard
- Brassica/Sinapsis spp.
- Brown Mustard
- ImmunoCAP f89
- White Mustard
- Yellow Mustard
- LAB3588-VML
- LAB3588VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- ImmunoCAP F283
- Greek Oregano
- Oreganum
- Origanum vulgare
- Wild Marjoram
- LAB3595-VML
- LAB3595VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Serum separator tube (SST). Multiple specimen tubes should be avoided. Include all available specimen.

Synonyms:

- Peanut molecular allergy
- Peanut Test
- uKnow Peanut
- Peanut Component Package
- LAB5971-VML
- LAB5971VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided

Collect:
Serum separator tube (SST). Multiple specimen tubes should be avoided. Include all available specimen.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.6 mL serum plus 0.1 mL for each additional allergen ordered to an ARUP Standard Transport Tube. (Min: 0.4 mL plus 0.04 mL for each allergen ordered)

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens

Storage/Transport Temperature:
Refrigerated

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Peanut molecular allergy
- Peanut Test
- uKnow Peanut
- Peanut Component Package
- LAB5971-VML
- LAB5971VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

Notes:
Test methodology uses solid-phase immunoassays against the whole peanut allergen (f13) and 6 antigenic epitopes (Ara h1, Ara h2, Ara h3, Ara h6, Ara h8, and Ara h9) and measures IgE antibody concentrations in patient serum or plasma. The binding of a specific IgE to an immobilized allergen component is detected by the addition of a secondary fluorescence-labeled anti-human IgE antibody.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Allergen, Food, Peanut IgE	Less than or equal to 0.34 kU/L
Allergen, Food, Severe Peanut Ara h 1	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 2	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 3	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 9	Less than or equal to 0.09 kU/L
Allergen, Food, Mild Peanut Ara h 8	Less than or equal to 0.09 kU/L
Allergen, Food, Severe Peanut Ara h 6	Less than or equal to 0.09 kU/L

Interpretive Data:

Allergen results of 0.10-0.34 kU/L for whole peanut are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

- Pignoles
- Pignola
- Pine Kernals
- Pinus edulis
- Pinyon Nut
- LAB3606-VML
- LAB3606VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- ImmunoCAP f253
- Pignoles
- Pignola
- Pine Kernals
- Pinus edulis
- Pinyon Nut
- LAB3606-VML
- LAB3606VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- ImmunoCAP f35
- Irish Potato
- Solanum tuberosum
- Spud
- LAB3612-VML
- LAB3612VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Allergen, Food, Scallop

LAB3620

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- ImmunoCAP f338 (Allergen, Food, Scallop)
- Pecten spp. (Allergen, Food, Scallop)
- LAB3620-VML
- LAB3620VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- ImmunoCAP f338 (Allergen, Food, Scallop)
- Pecten spp. (Allergen, Food, Scallop)
- LAB3620-VML
- LAB3620VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Allergen, Food, Strawberry

LAB3629

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Fragaria vesca (Allergen, Food, Strawberry)
- Fragaria virginiana (Allergen, Food, Strawberry)
- Fragaria alpina (Allergen, Food, Strawberry)
- Fragaria chiloensis (Allergen, Food, Strawberry)
- ImmunoCAP f44 (Allergen, Food, Strawberry)
- LAB3629-VML
- LAB3629VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Fragaria vesca (Allergen, Food, Strawberry)
- Fragaria virginiana (Allergen, Food, Strawberry)
- Fragaria alpina (Allergen, Food, Strawberry)
- Fragaria chiloensis (Allergen, Food, Strawberry)

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Synonyms:

- Common Thyme
- Garden Thyme
- ImmunoCAP f273
- Thymus vulgaris
- LAB3636-VML
- LAB3636VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Common Thyme
- Garden Thyme
- ImmunoCAP f273
- Thymus vulgaris
- LAB3636-VML
- LAB3636VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

- ImmunoCAP f234
- Vanilla fragrans
- Vanilla planifolia
- LAB3642-VML
- LAB3642VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- ImmunoCAP f234
- Vanilla fragrans
- Vanilla planifolia
- LAB3642-VML
- LAB3642VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Allergen, Food, Zucchini IgE

LAB3648

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- Cucurbita spp (Allergen, Food, Zucchini)
- LAB3648-VML
- LAB3648VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum plus 0.1 mL for each additional allergen ordered to an ARUP Standard Transport Tube. (Min: 0.34 mL plus 0.04 mL for each allergen ordered)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated or frozen.

Stability (from collection to initiation):
Ambient: 1 month; Refrigerated: 1 month; Frozen: 1 year

Performed:
Varies

Allergen, Grass, Cultivated Corn Pollen

LAB3656

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- Corn Pollen
- ImmunoCAP g202
- Maize Pollen
- Zea Mays Pollen
- LAB3656-VML
- LAB3656VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- Corn Pollen
- ImmunoCAP g202
- Maize Pollen
- Zea Mays Pollen
- LAB3656-VML
- LAB3656VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

LAB3663

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- ImmunoCAP i70
- Solenopsis invicta
- LAB3663-VML
- LAB3663VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Multiple patient encounters should be avoided.

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.25 mL). For multiple allergen orders refer to "Allergen Specimen Collection Instructions" at www.aruplab.com/testing/resources/specimen.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

ORDERING

Synonyms:

- ImmunoCAP i70
- Solenopsis invicta
- LAB3663-VML
- LAB3663VML

Performed:
Sun-Sat

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reference Interval:

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Reference Interval:
Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:
Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Methodology:
Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

FULL VIEW

Collect:
Serum separator tube. Multiple specimen tubes should be avoided.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.65 mL serum to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Patient Preparation:
Multiple patient encounters should be avoided.

Unacceptable Conditions:
Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- LAB3508-VML
- LAB3508VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
1-3 days

Interpretive Data:
Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Reference Interval:

Allergens included: Cat Epithelium & Dander, Cow Dander & Hair, Dog Dander, Feather Mix, Horse Hair & Dander

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5

Allergens included: Codfish/Whitefish, Crab, Lobster, Shrimp, Tuna.

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring
Less than 0.10	No significant level detected	0
0.10 - 0.34	Clinical relevance undetermined	0/1
0.35 - 0.70	Low	1
0.71 - 3.50	Moderate	2
3.51 - 17.50	High	3
17.51 - 50.00	Very high	4
50.01 - 100.00	Very high	5
Greater than 100.00	Very high	6

Interpretive Data:
Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative ImmunoCAP Fluorescent Enzyme Immunoassay

Serum separator tube. Multiple specimen tubes should be avoided.

Specimen Preparation:

Separate serum from cells ASAP or within 2 hours of collection. Transfer 0.95 mL serum to an ARUP Standard Transport Tube. (Min: 0.52 mL)

Patient Preparation:

Multiple patient encounters should be avoided.

Unacceptable Conditions:

Hemolyzed, icteric, or lipemic specimens.

Stability (from collection to initiation):

After separation from cells: Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Storage/Transport Temperature:

Refrigerated.

Synonyms:

- LAB3680-VML
- LAB3680VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-3 days

Interpretive Data:

Allergen results of 0.10-0.34 kU/L are intended for specialist use as the clinical relevance is undetermined. Even though increasing ranges are reflective of increasing concentrations of allergen-specific IgE, these concentrations may not correlate with the degree of clinical response or skin testing results when challenged with a specific allergen. The correlation of allergy laboratory results with clinical history and in vivo reactivity to specific allergens is essential. A negative test may not rule out clinical allergy or even anaphylaxis.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Reference Interval:

Allergens included: Birch Tree, Elm Tree, Box Elder/Maple Tree, Oak Tree, Pecan (White Hickory) Tree, Sweet Gum Tree, Sycamore Tree, Willow Tree.

Effective 02/18/2014

Reporting Range (reported in kU/L)	Probability of IgE Mediated Clinical Reaction	Class Scoring

Alpha Fetoprotein (Amniotic Fluid) with Reflex to Acetylcholinesterase and Fetal Hemoglobin

LAB5990

ORDERING INFO

Collect:
Amniotic fluid.

Synonyms:

- AFP
- AFP-AF (Alpha-Fetoprotein, Amniotic Fluid)
- Alpha Fetoprotein, Amniotic Fluid
- Alpha-Fetoprotein, Amniotic Fluid
- Fetoprotein, Amniotic Fluid
- LAB5990-VML
- LAB5990VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Amniocentesis. Specimen must be drawn between 13 weeks, 0 days and 36 weeks, 6 days gestation.

Collect:
Amniotic fluid.

Specimen Preparation:
Transport 2.5 mL amniotic fluid. (Min: 1.5 mL)

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 month; Refrigerated: 3 months; Frozen: 3 months

Performed:
Sun-Sat

Remarks:
Submit with Order: Gestational age at time of collection or estimated due date.

ORDERING

Synonyms:

- AFP
- AFP-AF (Alpha-Fetoprotein, Amniotic Fluid)
- Alpha Fetoprotein, Amniotic Fluid
- Alpha-Fetoprotein, Amniotic Fluid
- Fetoprotein, Amniotic Fluid
- LAB5990-VML
- LAB5990VML

Ordering Recommendations:
Evaluate possibility of a fetal open neural tube defect at 13-36 weeks of gestation.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay/Electrophoresis

Reported:
3-4 days

Notes:
Information must include weeks of gestation. If the AFP (amniotic fluid) is elevated, then Acetylcholinesterase will be added. Additional charges apply. Acetylcholinesterase testing requires an additional 3-11 days to be reported.

RESULTS INTERPRETATION

Gold (Clot Activator with Gel)

Specimen Preparation:

Allow specimen to clot completely at room temperature prior to centrifugation. Separate serum from cells ASAP or within 2 hours of collection. (Min 0.3 mL)

Pediatric Collection:

2 Gold Microtainers (Clot Activator with Gel)

Storage/Transport Temperature:

Refrigerated: 2° to 8°C

Performed:

Daily

Stability:

After separation from cells: 15° to 25°C: 5 days; 2° to 8°C: 14 days; Frozen: 6 months

Specimen:

Serum

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

AFP should be used in conjunction with other clinical and biochemical markers for the diagnosis and monitoring of testicular cancer. AFP may be used in conjunction with ultrasound in high risk patients to aid in the diagnosis and monitoring of hepatocellular carcinoma. AFP is not recommended for cancer screening in a general population. AFP may be elevated in other conditions including: hepatitis, drug induced hepatic damage, cirrhosis, gastrointestinal cancers, hereditary tyrosinemias and normal pregnancy. This assay is not intended for the prediction of neural tube defects in pregnant women. The serum AFP concentration alone does not provide absolute evidence of the presence of malignant disease. Patient results determined by assays using different manufacturers for methods may not be comparable.

Alpha Globin (*HBA1* and *HBA2*) Sequencing and Deletion/Duplication

LAB6130

ORDERING INFO

Collect:
Lavender (EDTA), pink (K2EDTA), or yellow (ACD solution A or B).

Synonyms:

- LAB6130-VML
- LAB6130VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA), pink (K2EDTA), or yellow (ACD solution A or B).

Specimen Preparation:
Transport 3 mL whole blood. (Min: 2 mL)

Unacceptable Conditions:
Frozen specimens

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: unacceptable

Performed:
Varies

ORDERING

Synonyms:

- LAB6130-VML
- LAB6130VML

Ordering Recommendations:
Comprehensive genetic test to detect alpha thalassemia or alpha thalassemia trait.

Performed:
Varies

Methodology:
Multiplex Ligation-Dependent Probe Amplification (MLPA)/Sequencing/Polymerase Chain Reaction (PCR)

Reported:
14-21 days

RESULTS INTERPRETATION

Interpretive Data:

Background Information for Alpha Globin (HBA1 and HBA2) Sequencing and Deletion/Duplication Characteristics:
Alpha thalassemia is caused by decreased or absent synthesis of the hemoglobin alpha chain resulting in variable clinical presentations. Alpha (+) thalassemia results from variants of a single HBA2 globin gene (-a/aa) and is clinically asymptomatic (silent carrier). Alpha (0) thalassemia (trait) is caused by variants of both HBA2 globin genes (-a/-a) or variants in the HBA1 and HBA2 globin genes on the same chromosome (--/aa) and results in mild microcytic anemia. Hemoglobin H disease occurs due to variants of three alpha globin genes (--/-a) and results in hemolysis with Heinz bodies, moderate anemia, and splenomegaly. Hb Bart hydrops fetalis syndrome results when variants occur in all four alpha globin genes (--/--) and is lethal in the fetal or early neonatal period. Alpha globin gene triplications result in three active alpha globin genes on a single chromosome. Nondeletional alpha globin variants may be pathogenic or benign; both may result in an abnormal protein detectable by hemoglobin evaluation. Pathogenic nondeletional variants often have a more severe effect than single gene deletions.
Incidence: Carrier frequency in Mediterranean (1:30-50), Middle Eastern, Southeast Asian (1:20), African, African American (1:3).
Inheritance: Autosomal recessive.
Cause: Pathogenic variants in the alpha globin gene cluster.
Clinical Sensitivity: 99 percent.
Methodology: Bidirectional sequencing of the HBA1 and HBA2 coding regions, intron-exon boundaries and 3' polyadenylation signal. Multiplex ligation-dependent probe amplification (MLPA) of the alpha globin gene cluster (HBZ, HBM, HBA1, HBA2, HBQ1) and its HS-40 regulatory region.
Analytical Sensitivity and Specificity: 99 percent.
Limitations: Diagnostic errors can occur due to rare sequence variations. Sequence analysis will not detect all regulatory region variants or variants in alpha globin cluster genes other than HBA1 and HBA2. Sequencing of both HBA1 and HBA2 may not be possible in individuals harboring large alpha globin deletions on both alleles. This assay is unable to sequence HBA2-HBA1 fusion genes; thus, HBA1 or HBA2 sequence variants occurring in cis with a 3.7 kb deletion or other HBA2-HBA1 hybrid gene will not be detected (e.g., Hb G -Philadelphia will not be detected when in cis with the 3.7 kb deletion). It may not be possible to determine phase of identified sequence variants. Specific breakpoints of large deletions/duplications will not be determined; therefore, it may not be possible to distinguish variants of similar size. Individuals carrying both a deletion and duplication within the alpha globin gene cluster may appear to have a normal number of alpha globin gene copies. Rare syndromic or acquired forms of alpha thalassemia associated with ATRX variants will not be detected.

Counseling and informed consent are recommended for genetic testing. Consent forms are available online.

Alpha Subunit, Free, Pituitary Glycoprotein Hormones (PGH)

LAB3687

ORDERING INFO

Collect:
Serum separator tube (SST) or plain red.

Synonyms:

- CG (Chorionic Gonadotropin)
- Free Alpha-Glycoprotein Subunit
- Alpha Subunit, HCG
- Alpha-HCG (Human Chorionic Gonadotropin)
- Alpha-Subunit of Pit Glycoprotein
- Alpha Glycoprotein Subunit
- Chorionic Gonadotropin (CG)
- Chorionic Gonadotropins, Alpha-Subunit
- LAB3687-VML
- LAB3687VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST) or plain red.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP standard transport tube. (Min: 0.25 mL) Freeze immediately.
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 24 hours; Refrigerated: 24 hours; Frozen: 6 months

Performed:
Varies

Alpha-1-Antitrypsin

LAB6068

ORDERING INFO

Collect:
Plasma separation tube or serum separator tube. Also acceptable: Lavender (EDTA), pink (K_2EDTA), Green (Lithium Heparin).

Synonyms:

- A1-Antitrypsin
- A1A
- AAT
- Alpha 1 Antitrypsin
- Anti-Alpha-1-Trypsin
- LAB6068-VML
- LAB6068VML

SPECIMEN REQUIREMENTS

Collect:
Plasma separation tube or serum separator tube. Also acceptable: Lavender (EDTA), pink (K_2EDTA), Green (Lithium Heparin).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Unacceptable Conditions:
Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 3 months; Frozen: 3 months (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- A1-Antitrypsin
- A1A
- AAT
- Alpha 1 Antitrypsin
- Anti-Alpha-1-Trypsin
- LAB6068-VML
- LAB6068VML

Ordering Recommendations:
Determines alpha-1-antitrypsin (AAT) enzyme plasma concentration for the initial evaluation of AAT deficiency.

Performed:
Sun-Sat

Methodology:
Quantitative Immunoturbidimetry

Reported:
Within 24 hours

RESULTS INTERPRETATION

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.4 mL)

Unacceptable Conditions:
CSF. Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 7 days; Frozen: 3 months (if frozen within 24 hours; avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- a2-macroglobulin
- A2M/a2M
- AMG, macroglobulin
- Macroglobulin, Alpha-2
- LAB3690-VML
- LAB3690VML

Ordering Recommendations:
May be used as a marker of membrane permeability in urine or as an indirect marker for liver fibrosis.

Performed:
Sun-Sat

Methodology:
Quantitative Nephelometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
131-293 mg/dL

Methodology:
Quantitative Nephelometry

ADDITIONAL INFORMATION

Alpha-Fetoprotein (polyclonal) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath38

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- AFP

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Ordering Indicators:
N/A

Synonyms:

- AFP

Performed:
Monday-Friday

Turn Around Time:
2 Days

Methodology:
Immunohistochemical Stain

Components:
Stained slide and control

RESULTS INTERPRETATION

Alpha-Galactosidase, Serum

LAB3686

ORDERING INFO

Collect:
Serum separator tube (SST). Also acceptable: Plain red.

Synonyms:

- Soft AGAS (Alpha Galactosidase, Serum)
- Anderson Fabry Disease (Alpha Galactosidase, Serum)
- Ceramide Trihexosidase
- GLA Deficiency (Alpha Galactosidase, Serum)
- LAB3686-VML
- LAB3686VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube (SST). Also acceptable: Plain red.

Specimen Preparation:
Transfer 2 mL serum to an ARUP standard transport tube. (Min: 0.2 mL)
Test is not performed at ARUP; separate specimens must be submitted when multiple tests are ordered.

Unacceptable Conditions:
Thawed specimens.

Storage/Transport Temperature:
CRITICAL FROZEN.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 24 hours; Frozen: 2 weeks

Performed:
Varies

Remarks:
Physician name and phone number are required.

ORDERING

Synonyms:

- Soft AGAS (Alpha Galactosidase, Serum)
- Anderson Fabry Disease (Alpha Galactosidase, Serum)
- Ceramide Trihexosidase
- GLA Deficiency (Alpha Galactosidase, Serum)
- LAB3686-VML
- LAB3686VML

Ordering Recommendations:
Enzyme testing is reliable for diagnosing Fabry disease in males; it does not detect carriers. For carrier status, DNA analysis is recommended.

Performed:
Varies

Methodology:
Quantitative Fluorometry

Reported:
4-11 days

Notes:
Results for this assay are not useful for carrier determination. Carriers usually have levels in the normal range.

RESULTS INTERPRETATION

Reference Interval:
By report

Methodology:
Quantitative Fluorometry

ADDITIONAL INFORMATION

CPT Codes:
82657

Section:
RF-ARUP

Remarks:
Physician name and phone number are required.

Notes:

Alternative Complement Pathway Activity (AH50)

LAB3724

ORDERING INFO

Collect:
Plain Red

Synonyms:

- Functional Complement
- Hemolytic Complement
- AH50
- Alternate Pathway
- atypical hemolytic uremic syndrome
- C3 glomerulonephrits
- Dense-deposit disease
- LAB3724-VML
- LAB3724VML

SPECIMEN REQUIREMENTS

Collect:
Plain Red

Specimen Preparation:
Allow specimen to clot for one hour at room temperature. Separate serum from cells ASAP and centrifuge at 2-8 degrees C and aliquot serum into ARUP standard transport tube. Freeze specimen immediately at -70 degrees C or lower freezer. (Min: 0.3 mL)

Unacceptable Conditions:
Specimen types other than serum collected from RED TOP tubes. SST or serum gel tubes are not acceptable. Refrigerated or room temperature specimens. Specimens left to clot at refrigerated temperature. Specimens exposed to repeated freeze/thaw cycles. Grossly hemolyzed or grossly lipemic specimens or icteric specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: unacceptable; Refrigerated: Unacceptable; Frozen: 30 days if kept at -70 C

Performed:
Sun, Wed

ORDERING

Synonyms:

- Functional Complement
- Hemolytic Complement
- AH50
- Alternate Pathway
- atypical hemolytic uremic syndrome
- C3 glomerulonephrits
- Dense-deposit disease
- LAB3724-VML
- LAB3724VML

Ordering Recommendations:
Initial screening for suspected deficiency in the alternative complement pathway.

Performed:
Sun, Wed

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)

Reported:
7-14 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Alternative Complement Pathway Activity	31 percent normal or greater

Interpretive Data:
See report.

Aluminum, Serum

LAB665

ORDERING INFO

Collect:
Royal Blue (No Additive).

Synonyms:

- Al
- Al, Serum
- Aluminium
- Aluminum
- Aluminum, serum
- LAB665-VML
- LAB665VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patient should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician).

Collect:
Royal Blue (No Additive).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Trace Element-Free Transport Tube (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 0.5 mL)

Unacceptable Conditions:
Plasma. Specimens that are not separated from the red cells or clot within 2 hours. Specimens collected in containers other than specified. Specimens transported in containers other than specified.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated or frozen.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Indefinitely (If the specimen is drawn and stored in the appropriate container, the trace element values do not change with time.)

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- Al
- Al, Serum
- Aluminium
- Aluminum
- Aluminum, serum
- LAB665-VML
- LAB665VML

Ordering Recommendations:
Preferred test for routine aluminum screening. May be useful in the assessment of aluminum toxicity due to dialysis. Aluminum urine testing is preferred for chronic exposure.

Performed:
Tue, Thu, Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-4 days

RESULTS INTERPRETATION

Reference Interval:
0.0-15.0 µg/L

Interpretive Data:
Serum aluminum greater than 50.0 µg/L is consistent with overload and may correlate with toxicity.

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of serum aluminum, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry

Amino Acid Screen, plasma

LAB811

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB811, AA
- LAB811-VML
- LAB811VML

Turn Around Time:

STAT: 24 hours (STAT testing must be called to lab in advance and approved by the medical director) Routine: 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Patient should be fasting for 2 - 3 hours prior to collection. Newborn infants are preferrable to be collected 24 hr after birth.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Samples should be delivered to the laboratory on ice within 4 hours of collection. Samples from outside facilities should be sent as spun, separated, and frozen aliquot. (Minimum 150 uL plasma)

Pediatric Collection:

Lavender microtainer (EDTA)

Storage/Transport Temperature:

Frozen (-20°C)

Performed:

Monday - Friday

Stability:

After separation from cells: Frozen (-20°C): 6 months

Specimen:

Plasma

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

This test is used in the diagnosis and monitoring of amino acid disorders, also called amino acidopathies a type of inborn errors.

Synonyms:

- LAB811, AA
- LAB811-VML
- LAB811VML

Performed:

Monday - Friday

Turn Around Time:

STAT: 24 hours (STAT testing must be called to lab in advance and approved by the medical director) Routine: 3 days

Methodology:
Liquid chromatography/tandem mass spectrometry

Components:
Hydroxyproline, Histidine, Asparagine, Taurine, Serine, Glutamine, Arginine, Glycine, Aspartic Acid, Glutamic Acid, Citrulline, Threonine, Alanine, Proline, Alpha Aminobutyric Acid, Ornithine, Cystine, Lysine, Tyrosine, Methionine, Valine, Isoleucine, Leucine, Phenylalanine, Tryptophan, Miscellaneous Amino Acid

RESULTS INTERPRETATION

Reference Interval:
Supplied with results

Interpretive Data:
This test was developed and its performance characteristics determined by Vanderbilt Diagnostic Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Liquid chromatography/tandem mass spectrometry

ADDITIONAL INFORMATION

Section:

Alternate Specimen:
N/A

Additional Information:
N/A

Components:
Hydroxyproline, Histidine, Asparagine, Taurine, Serine, Glutamine, Arginine, Glycine, Aspartic Acid, Glutamic Acid, Citrulline, Threonine, Alanine, Proline, Alpha Aminobutyric Acid, Ornithine, Cystine, Lysine, Tyrosine, Methionine, Valine, Isoleucine, Leucine, Phenylalanine, Tryptophan, Miscellaneous Amino Acid

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Samples should be delivered to the laboratory on ice within 4 hours of collection. Samples from outside facilities should be sent as spun, separated, and frozen aliquot. (Minimum 150 uL plasma)

Pediatric Collection:
Lavender microtainer (EDTA)

Preferred Collection Volume:
1.5 mL blood

Alternate Specimen:
N/A

Patient Preparation:
Patient should be fasting for 2 - 3 hours prior to collection. Newborn infants are preferrable to be collected 24 hr after birth.

Specimen:
Plasma

Reasons for Rejection:
Clotted sample, improper collection, mislabeled, QNS, not sent on ice, not processed within 4 hours of collection

Components:
Hydroxyproline, Histidine, Asparagine, Taurine, Serine, Glutamine, Arginine, Glycine, Aspartic Acid, Glutamic Acid, Citrulline, Threonine, Alanine, Proline, Alpha Aminobutyric Acid, Ornithine, Cystine, Lysine, Tyrosine, Methionine, Valine, Isoleucine, Leucine, Phenylalanine, Tryptophan, Miscellaneous Amino Acid

Stability:
After separation from cells: Frozen (-20°C): 6 months

Storage/Transport Temperature:
Frozen (-20°C)

Synonyms:

- LAB811, AA
- LAB811-VML
- LAB811VML

Performed:
Monday - Friday

Resulting Laboratory:

Aminolevulinic Acid (ALA), Urine

LAB356

ORDERING INFO

Collect:
24 hour or random urine. Refrigerate 24-hour specimens during collection.

Synonyms:

- ALA
- Delta-ALA
- Delta-Aminolevulinic Acid
- 5-Aminolevulinic Acid
- LAB356-VML
- LAB356VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Refrain from alcohol consumption 24 hours prior to collection.

Collect:
24 hour or random urine. Refrigerate 24-hour specimens during collection.

Specimen Preparation:
Transfer a 4 mL aliquot from a well-mixed 24 hour or random collection to an ARUP Standard Transport Tube. (Min: 1.2 mL)

Unacceptable Conditions:
Body fluids other than urine.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 2 weeks; Frozen: 1 month

Performed:
Mon, Wed, Fri

Remarks:
Record total volume and collection time interval on transport tube and test request form.

ORDERING

Synonyms:

- ALA
- Delta-ALA
- Delta-Aminolevulinic Acid
- 5-Aminolevulinic Acid
- LAB356-VML
- LAB356VML

Ordering Recommendations:
Evaluate suspected aminolevulinic acid dehydratase deficiency (ADP) porphyria or hereditary tyrosinemia.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Ion Exchange Chromatography/Spectrophotometry

Reported:
1-4 days

Notes:
Increased ALA concentration is associated with exposure to alcohol, lead, and a variety of other agents. Massive elevation of ALA occurs in the acute porphyrias and hereditary tyrosinemia.

Specimen preservation with acid or base is discouraged and may cause assay interference. When collecting urine for additional tests that require acid or base preservation, the ALA aliquot should be removed prior to the addition of the acid or base.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Aminolevulinic Acid - per volume	0-35 µmol/L
Aminolevulinic Acid - per 24h	0-60 µmol/d
Creatinine, Urine - per 24h	

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Interpretive Data:

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

Methodology:

Quantitative Ion Exchange Chromatography/Spectrophotometry

ADDITIONAL INFORMATION

CPT Codes:

82135

Amiodarone and Metabolite

LAB567

ORDERING INFO

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Synonyms:

- Cordarone
- Nexterone
- Pacerone
- LAB567-VML
- LAB567VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Timing of specimen collection: Predose (trough) draw - at steady state concentration.

Collect:
Plain red. Also acceptable: Lavender (K2 or K3EDTA) or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP amber standard transport tube to protect from light. Freeze immediately (Min: 0.5 mL)

Unacceptable Conditions:
Whole blood. Gel separator tubes, light blue (citrate), or yellow (SPS or ACD solution). Refrigerated or room temperature specimens.

Storage/Transport Temperature:
Critical Frozen. Additional specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 year

Performed:
Mon, Tue, Thu, Fri, Sat

ORDERING

Synonyms:

- Cordarone
- Nexterone
- Pacerone
- LAB567-VML
- LAB567VML

Ordering Recommendations:
Use to optimize drug therapy and monitor patient adherence.

Performed:
Mon, Tue, Thu, Fri, Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:

Therapeutic Range	0.5-2.0 µg/mL
Toxic Level	Greater than 2.5 µg/mL

Interpretive Data:
Toxic concentrations may exacerbate arrhythmias, cause liver and lung toxicity, and thyroid dysfunction. The concentration of desethylamiodarone, an active major metabolite, is also reported but no therapeutic range is established. At steady-state, the metabolite concentration is similar to the amiodarone concentration.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Ammonia, Plasma

LAB47

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- AMO, Ammonia Blood, Ammonia Level, LAB47
- LAB47-VML
- LAB47VML

Turn Around Time:
STAT: 1 hour; Routine: 2 hours

SPECIMEN REQUIREMENTS

Patient Preparation:
Smoking should be avoided prior to sampling.

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Deliver to lab immediately on ice. Separate plasma from cells and freeze within 15 minutes of draw time. Specimens need to be spun in a refrigerated centrifuge (Min 0.3 mL).

Pediatric Collection:
1 Lavender Microtainer (EDTA)

Storage/Transport Temperature:
Place immediately on ice and centrifuge, preferably at 2 8 °C. Perform analysis within 60 minutes ofvenipuncture or freeze separated plasma immediately.

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 30 mins; 2° to 8°C: 2 hours; Frozen: 3 days

- LAB6107-VML
- LAB6107VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Amphetamines Urine Screen with Reflex to Quantitation (2012209).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Compare to Pain Management, MDMA/MDA, Quantitative, with medMATCH, Urine; Pain Management, Amphetamines, with Confirmation with medMATCH, Urine; Pain Management, Amphetamines, Quantitative, with medMATCH, Urine.

RESULTS INTERPRETATION

Reference Interval:
Effective November 11, 2018

Drugs Covered	Cutoff Concentrations
Amphetamine	50 ng/mL
Methamphetamine	200 ng/mL
Methylenedioxyamphetamine (MDA)	200 ng/mL
Methylenedioxymethamphetamine (Ecstasy, MDMA)	200 ng/mL
Methylenedioxyethylamphetamine (Eve, MDEA)	200 ng/mL
Phentermine	200 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry.

Positive cutoff: 200 ng/mL unless specified below:
Amphetamine: 50 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Section:
RF-ARUP

CPT Codes:

80325; 80359 (Alt code: G0480)

Notes:

Compare to Pain Management, MDMA/MDA, Quantitative, with medMATCH, Urine; Pain Management, Amphetamines, with Confirmation with medMATCH, Urine; Pain Management, Amphetamines, Quantitative, with medMATCH, Urine.

Amylase, Body Fluid

LAB6557

ORDERING INFO

Collect:
Sterile Container

Synonyms:

- Body Fluid Amylase, BFAMY , LAB6557
- LAB6557-VML
- LAB6557VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Sterile Container

Specimen Preparation:
Centrifuge and separate to remove cellular material (Min 0.5 mL). Specify fluid type

Pediatric Collection:
1 Sterile Container

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
15° to 25°C: 1 day; 2° to 8°C: 3 days; Frozen: unacceptable

Specimen:
Body Fluid

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:
N/A

Synonyms:

- Body Fluid Amylase, BFAMY , LAB6557
- LAB6557-VML
- LAB6557VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Enzymatic Assay

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
The reference interval for this body fluid is unavailable. Comparison of this result with the concentration in the serum, or plasma is recommended.

Interpretive Data:
N/A

Methodology:
Enzymatic Assay

ADDITIONAL INFORMATION

Amylase, Isoenzymes

LAB3691

ORDERING INFO

Collect:
Serum separator tube or plasma separator tube. Also acceptable: Green (lithium heparin).

Synonyms:

- AMYISO
- Amylase Fractionation
- Pancreatic Isoamylase
- LAB3691-VML
- LAB3691VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or plasma separator tube. Also acceptable: Green (lithium heparin).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Body Fluids (refer to Amylase, Body Fluid, ARUP test code 0020506). Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 1 month; Frozen: 1 month

Performed:
Sun-Sat

ORDERING

Synonyms:

- AMYISO
- Amylase Fractionation
- Pancreatic Isoamylase
- LAB3691-VML
- LAB3691VML

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay

Reported:
Within 24 hours

Notes:
Salivary amylase is calculated as the difference between the total and pancreatic amylase.

RESULTS INTERPRETATION

Reference Interval:

Effective February 22, 2022

Component	Reference Interval
Pancreatic amylase	6-35 months: 2-28 U/L 3-6 years: 8-34 U/L 7-17 years: 9-39 U/L 18 years and older: 13-53 U/L
Salivary amylase	18 months and older: 9-86 U/L
Total amylase	3-90 days: 0- 30 U/L 3-6 months: 7-40 U/L 7-8 months: 7-57 U/L 9-11 months: 11-70 U/L 12-17 months: 11-79 U/L 18-35 months: 19-92 U/L 3-4 years: 26-106 U/L 5-12 years: 30-119 U/L 13 years and older: 28-100 U/L

ANAL PAP CYTOLOGY VUMC

LAB904

ORDERING INFO

Collect:

Non-gyn ThinPrep Preservcyt vial

Synonyms:

- NGY, LAB904,Anal pap smear
- LAB904-VML
- LAB904VML

Turn Around Time:

4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Non-gyn ThinPrep Preservcyt vial

Specimen Preparation:

1. Collect specimen using a moistened Dacron swab or cytobrush. 2.Rinse collection device as quickly as possible in the PreservCyt® Solution by rotating the device in the solution 10 times while pushing against the PreservCyt vial wall. Swirl the device vigorously to further release material. 3. Discard the device. 4. Place Epic order for Cytology Anal Pap. 4. Complete collection task in Epic. 5. Specimen vial is to be labeled with generic ADT label. 6. Please send Epic requisition and specimen vial to the lab. Visit www.hologic.com for clinical information regarding the ThinPrep Anal Pap. (Minimum: 1 Non-gyn ThinPrep Preservcyt vial)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient: (15-25°C).

Performed:

Monday-Friday

Stability:
Ambient: (15-25°C) 6 weeks

Specimen:
Anal sample in ThinPrep vial

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is ordered to look for cancerous and pre-cancerous disease processes in the anal mucosa. HPV co-testing will be preformed unless declined by provider. Lab must have presenting ICD-10 code.

Synonyms:

- NGY, LAB904,Anal pap smear
- LAB904-VML
- LAB904VML

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
Anal Pap smear: This test shows morphological characteristics reflecting benign and malignant disease processes.

Methodology:
ThinPrep procedure

ADDITIONAL INFORMATION

Androstenedione

LAB3692

ORDERING INFO

Collect:
Serum separator tube or green (sodium or lithium heparin).

Synonyms:

- LAB3692-VML
- LAB3692VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Specimen should be collected between 6-10 a.m.

Collect:
Serum separator tube or green (sodium or lithium heparin).

Specimen Preparation:
Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.3 mL) Also acceptable: EDTA plasma.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 1 week; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- LAB3692-VML
- LAB3692VML

Ordering Recommendations:
Aids in the investigation of virilizing endocrinopathies and in managing congenital adrenal hyperplasia in conjunction with other sex steroids. Not recommended for initial evaluation of polycystic ovarian syndrome.

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Angiotensin Converting Enzyme, CSF

LAB180

ORDERING INFO

Collect:
CSF.

Synonyms:

- ACE
- LAB180-VML
- LAB180VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 1 mL CSF to an ARUP standard transport tube. (Min: 0.5 mL)

Unacceptable Conditions:
CSF containing gadolinium-based contrast agents. Hemolyzed or xanthochromic specimens.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 4 hours; Refrigerated: 1 week; Frozen: 6 months

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- ACE
- LAB180-VML
- LAB180VML

Ordering Recommendations:
Use to support a diagnosis of neurosarcoidosis. May be used to evaluate treatment response.

Performed:
Mon, Wed, Fri

Methodology:
Quantitative Spectrophotometry

Reported:
1-5 days

Notes:
Gadolinium contrast agents have been reported to inhibit ACE activity. Therefore, CSF containing gadolinium-based contrast agents should not be submitted to the laboratory for evaluation.

RESULTS INTERPRETATION

Reference Interval:
0.0-2.5 U/L

Methodology:
Quantitative Spectrophotometry

ADDITIONAL INFORMATION

CPT Codes:
82164

Section:
RF-ARUP

Notes:
Gadolinium contrast agents have been reported to inhibit ACE activity. Therefore, CSF containing gadolinium-based contrast agents should not be submitted to the laboratory for evaluation.

Angiotensin Converting Enzyme, Serum

LAB179

ORDERING INFO

Collect:
Serum Separator Tube (SST).

Synonyms:

- Angiotensin-1-Converting Enzyme
- Angiotensin-1-Converting Enzyme Kinase II Peptidylpeptide Hydrolase
- Kinase II
- Peptidylpeptide Hydrolase
- ACE
- Angiotensin Converting Enzyme
- SACE
- Serum Angiotensin Converting Enzyme
- LAB179-VML
- LAB179VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
EDTA or heparin plasma. Hemolyzed specimens. CSF (refer to Angiotensin Converting Enzyme, CSF test code 0098974).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 1 week; Frozen: 6 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Angiotensin-1-Converting Enzyme
- Angiotensin-1-Converting Enzyme Kinase II Peptidylpeptide Hydrolase
- Kinase II
- Peptidylpeptide Hydrolase
- ACE
- Angiotensin Converting Enzyme
- SACE
- Serum Angiotensin Converting Enzyme
- LAB179-VML
- LAB179VML

Performed:
Sun-Sat

Methodology:
Quantitative Enzymatic Assay

Reported:
Within 24 hours

Notes:
Note: Measurement of ACE activity for the evaluation of sarcoidosis is not reliable when ACE inhibitors are present. Serum ACE activity is markedly reduced in patients on ACE inhibitor therapy.

RESULTS INTERPRETATION

Reference Interval:
0-6 years: 18-90 U/L
7-14 years: 24-121 U/L
15-17 years: 18-101 U/L

Antifungal Level, 5-Fluorocytosine (5-FC)

LAB3499

ORDERING INFO

Collect:
Plain red.

Synonyms:

- 5-Flucytosine
- 5-Flucytosine level
- 5-Flucytosine, Serum
- Ancobon serum levels
- Antimicrobial Assay, 5-Flucytosine
- Fluorocytosine antifungal level
- LAB3499-VML
- LAB3499VML

SPECIMEN REQUIREMENTS

Collect:
Plain red.

Specimen Preparation:
Aseptically remove 2 mL serum to a sterile tube (ARUP supply #43115) and freeze. Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL).

Unacceptable Conditions:
Plasma.

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: 2 hours; Refrigerated: 24 hours; Frozen: 1 week

Performed:
Sun-Sat

Remarks:
Required information includes: time and date of collection, time of last dose, and list of all antibiotics that the patient is receiving or has received in the past 48 hours.

ORDERING

Synonyms:

- 5-Flucytosine
- 5-Flucytosine level
- 5-Flucytosine, Serum
- Ancobon serum levels
- Antimicrobial Assay, 5-Flucytosine
- Fluorocytosine antifungal level
- LAB3499-VML
- LAB3499VML

Ordering Recommendations:
Monitor levels of antifungal drug, 5-fluorocytosine.

Performed:
Sun-Sat

Methodology:
Quantitative Bioassay

Reported:
2-3 days

Notes:
Please include time of last dose, and list of all antibiotics that the patient is receiving or has received in the past 48 hours. This information is important for laboratory handling and essential for subsequent physician interpretation of results.

RESULTS INTERPRETATION

Interpretive Data:

Normal peak serum concentration for 5-fluorocytosine is 30-45 µg/mL with a 2 g PO dose or 60-80 µg/mL with a 100 mg/kg/day PO dose. Trough serum concentration is not well established. Toxicity may be seen with sustained levels greater than 100 µg/mL.

For bioassay measurements, the presence of other antimicrobial agents may interfere with the assay. Other factors that may influence antimicrobial levels include inherent differences among patients and their underlying physical conditions as well as the dose and route of administration of the antimicrobial agent.

Methodology:

Quantitative Bioassay

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Preferred Collection Volume:
Whole Blood: 1.5 mL

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Patient Preparation:
NA

Specimen:
Serum

Reasons for Rejection:
Gross lipemia Gross hemolysis

Components:
AMA Screen

Stability:
Refrigerated (2-8°C): 5 days

Storage/Transport Temperature:
Refrigerated (2-8°C)

Synonyms:

- LAB513, AMA
- LAB513-VML
- LAB513VML

Performed:
Monday - Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 - 3 Days

Ordering Indicators:
This test is used to confirm a diagnosis of primary biliary cholangitis.

Interpretive Data:
A positive results is indicative of primary biliary cholangiris (PBC). A negative result does not rule out PBC.

Reference Interval:
Negative

Additional Information:
AMA Titer will be performed if screening dilution is positive.

Methodology:
Indirect Immunofluorescence

Section:
Immunoserology

Anti-Mullerian Hormone

LAB1733

ORDERING INFO

Collect:
Serum separator tube. Also acceptable: Plain red or green (lithium heparin).

Synonyms:

- MIH
- MIS
- Mullerian inhibiting factor
- Mullerian-inhibiting substance
- AntiMullerian
- MIF
- Mullerian-inhibiting hormone
- LAB1733-VML
- LAB1733VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Also acceptable: Plain red or green (lithium heparin).

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: 1 week; Frozen: 3 weeks (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- MIH
- MIS
- Mullerian inhibiting factor
- Mullerian-inhibiting substance
- AntiMullerian
- MIF
- Mullerian-inhibiting hormone
- LAB1733-VML
- LAB1733VML

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme-Linked Immunosorbent Assay

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Effective April 7, 2014

Female, Age	Reference Interval	Male, Age	Reference Interval
6 months - 14 years	0.256-6.345 ng/mL	6-11 months	56.677-495.299 ng/mL
15-17 years	0.861-10.451 ng/mL	1-6 years	33.442-342.450 ng/ml
18-29 years	0.401-16.015 ng/mL	7-9 years	20.245-189.781 ng/mL
30-39 years	0.176-11.705 ng/mL	10-12 years	2.903-178.243 ng/mL
40-45 years	6.282 ng/mL or less	13 years or greater	2.079-30.656 ng/mL
46-50 years	0.064 ng/mL or less		
Post-menopausal	0.003 ng/mL or less		

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative Enzyme-Linked Immunosorbent Assay

Anti-Neurofilament H(NF-H) Nonphosphorylated SMI-32 (SMI32) Immunohistochemical Stain, Formalin Fixed Paraffin Embedded Tissue

CoPath204

ORDERING INFO

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Synonyms:

- SMI-32, HFNH

Turn Around Time:
2 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Performed:
Monday-Friday

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Specimen:
Unstained Tissue Slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

ORDERING

Ordering Indicators:

Anti-Neutrophil Cytoplasmic Antibody IgG, serum

LAB458

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB458, ANC, Anti Neutrophilic Cytoplasmic Antibodies
- LAB458-VML
- LAB458VML

Turn Around Time:
1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Ambient (15-25°C): 8 hours, Refrigerated (2-8°C): 48 hours

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used to evaluate patients with signs and symptoms of ANCA-associated vasculitis.

Synonyms:

- LAB458, ANC, Anti Neutrophilic Cytoplasmic Antibodies
- LAB458-VML
- LAB458VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
Indirect immunofluorescence and Multiplex Flow Immunoassay

Components:
Anti-MPO EIA, Anti-PR3 EIA, ANCA IFA

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result of ANCA is indicative for ANCA-associated vasculitis (AAV), which includes granulomatosis with polyangiitis, microscopic polyangiitis, eosinophilic granulomatosis with polyangiitis. A negative reuslt of ANCA do not rule out a diagnosis of AAV or irritable bowel disease.

Methodology:
Indirect immunofluorescence and Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Additional Information:
Specimens will also be tested for MPO IgG and PR3 IgG.

Components:
Anti-MPO EIA, Anti-PR3 EIA, ANCA IFA

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Preferred Collection Volume:
Whole Blood: 1.5 mL

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Patient Preparation:
NA

Specimen:
Serum

Reasons for Rejection:
Gross hemolysis, gross lipemia, bacterial contamination

Components:
Anti-MPO EIA, Anti-PR3 EIA, ANCA IFA

Stability:
Ambient (15-25°C): 8 hours, Refrigerated (2-8°C): 48 hours

Storage/Transport Temperature:
Refrigerated (2-8°C)

Synonyms:

- LAB458, ANC, Anti Neutrophilic Cytoplasmic Antibodies
- LAB458-VML
- LAB458VML

Performed:
Monday - Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 - 3 Days

Ordering Indicators:
This test is used to evaluate patients with signs and symptoms of ANCA-associated vasculitis.

Immunoserology

Antinuclear Antibodies (ANA) IgG by IFA with Reflex to Extractable Nuclear Antigen (ENA) Antibodies and dsDNA IgG, serum and/or plasma

LAB3458

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB3458, ANS, ANA Survey, ANA Reflex with ENA/DNA
- LAB3458-VML
- LAB3458VML

Turn Around Time:
1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum and 0.5 mL plasma)

Pediatric Collection:
Three Red Microtainers (no gel), AND Three Lavender Microtainers (EDTA)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
ANA: serum ENA: serum or plasma DNA: serum

Alternate Specimen:
ANA and/or ENA: Gold SST tube (Clot activator with gel) ENA: Lavender tube (EDTA), Light green tube (Lithium heparin with gel), Dark green tube (Sodium heparin)

ORDERING

Ordering Indicators:
This test is used to evaluate patients with signs and symptoms of systemic lupus erythematosus and other connective tissue diseases

Synonyms:

- LAB3458, ANS, ANA Survey, ANA Reflex with ENA/DNA
- LAB3458-VML
- LAB3458VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
IFA, Enzyme-linked Immunoassay, Multiplex Flow Immunoassay

Components:
ANA, ANA titer

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
Positive results for these antibodies are suggestive of connective tissue diseases such as Systemic Lupus Erythematosus, Sjogren's Syndrome, Scleroderma, and Polymyositis.

Methodology:
IFA, Enzyme-linked Immunoassay, Multiplex Flow Immunoassay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
ANA and/or ENA: Gold SST tube (Clot activator with gel) ENA: Lavender tube (EDTA), Light green tube (Lithium heparin with gel), Dark green tube (Sodium heparin)

Additional Information:
Additional testing (Anti-dsDNA, SSA, SSB, ScL 70, Smith, RNP) will be performed on positive ANA results with titer > or = 1:80

Components:
ANA, ANA titer

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum or plasma from cells ASAP, store refrigerated. (Minimum 0.5 mL serum and 0.5 mL plasma)

Anti-nuclear Antibodies, IgG, Serum

LAB147

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- LAB147, ANA, Anti-Nuclear Antibody
- LAB147-VML
- LAB147VML

Turn Around Time:
1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
NA

Collect:
Red tube (no gel)

Specimen Preparation:
Separate serum from cells ASAP, store refrigerated. (Minimum 0.5 mL serum)

Pediatric Collection:
Two Red Microtainers (no gel)

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Refrigerated (2-8°C): 7 days

Specimen:
Serum

Alternate Specimen:
Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is a screening test for the evaluation of patients at-risk for antinuclear antibodies-associated systemic autoimmune rheumatic diseases particularly systemic lupus erythematosus, Sjogren syndrome, and mixed connective tissue disease

Synonyms:

- LAB147, ANA, Anti-Nuclear Antibody
- LAB147-VML
- LAB147VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
Indirect Immunofluorescence Assay

Components:
ANA

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
The antinuclear autoantibodies are frequently detected in patients with systemic autoimmune rheumatic diseases (SARD), especially systemic lupus erythematosus (SLE). While the presence of high-titered ANA is suggestive of connective tissue diseases, it should not be used as the sole basis for diagnosis.

Methodology:
Indirect Immunofluorescence Assay

ADDITIONAL INFORMATION

Section:
Immunoserology

Alternate Specimen:
Gold SST tube (Clot activator with gel)

Additional Information:
Quantitative ANA Titer by IFA will be performed on positive samples. Other follow-up testing is only performed when requested by physician.

Antiphospholipid Antibody Panel

LAB2307

ORDERING INFO

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Synonyms:

- LAB2307, LUP, Antiphospholipid Antibody Panel, LA Profile, Lupus Anticoag Profile
- LAB2307-VML
- LAB2307VML

Turn Around Time:

2-6 days, 7-10 days for interpretive report

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Two Light blue tubes (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, double centrifugation is required. Transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: Two 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: Two 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Twice weekly, variable days.

Stability:

Refrigerated (2-8°C): 8 Hours, frozen at -70C: 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:
Antiphospholipid antibody panel should be ordered to assess for antiphospholipid antibody syndrome. This test should not be ordered on patients in the ED or inpatients due to the risk of false positive results in the setting of physiologic stress.

Synonyms:

- LAB2307, LUP, Antiphospholipid Antibody Panel, LA Profile, Lupus Anticoag Profile
- LAB2307-VML
- LAB2307VML

Performed:
Twice weekly, variable days.

Turn Around Time:
2-6 days, 7-10 days for interpretive report

Methodology:
Clotting, ELISA

Components:
APTT, TT, LMWH, ACL, BGP, dRVVT, LAS, BGP. If indicated, PTT 1:1 mixing study, cRVVT 1:1 mixing study, and dRVVT confirm.

RESULTS INTERPRETATION

Reference Interval:
Refer to individual test components: APTT, TT, APA, DRVVT, LAS, BGP

Interpretive Data:
Direct Thrombin (IIa) and both Direct and Indirect anti-Xa inhibitors will interfere with these assays.

Methodology:
Clotting, ELISA

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
In-patient testing must by approved by the Coagulation Medical Director on-call (refer to Synergy for contact information). Request can be submitted using the following link: redcap.link/misc-coag .

Components:
APTT, TT, LMWH, ACL, BGP, dRVVT, LAS, BGP. If indicated, PTT 1:1 mixing study, cRVVT 1:1 mixing study, and dRVVT confirm.

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:

Preferred Collection Volume:
Fill all tubes to indicator line.

Alternate Specimen:
N/A

Patient Preparation:
Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Specimen:
Citrated platelet poor plasma .

Reasons for Rejection:
Incorrect tube type, clotted, incorrect fill volume, received on ice, grossly hemolyzed, grossly icteric, grossly lipemic. Whole blood > 4 hours after collection. Thawed plasma aliquots.

Components:
N/A

Stability:
Ambient (15-25°C): 4 hours, Frozen: -70C 1 month

Storage/Transport Temperature:
Ambient: (15-25°C) or send as a frozen plasma aliquot if sample will not be received into the lab within 4 hours

Synonyms:

- LAB311, Antithrombin Activity, AT3, AT, AT Act
- LAB311-VML
- LAB311VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
4 hours

Ordering Indicators:
N/A

Interpretive Data:
Direct Thrombin (IIa) inhibitors can affect the AT results. Anti-IIa inhibitors specifically target thrombin and may lead to an overestimation of antithrombin.

Reference Interval:
75 - 140%

Additional Information:
The STAChrom AT activity assay is insensitive to the presence of direct anti-Xa inhibtors.

Methodology:
Chromogenic

Section:
Coagulation

Antithrombin Antigen

LAB759

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB759, ATG, AT3 Antigen, AT AG
- LAB759-VML
- LAB759VML

Turn Around Time:

1 - 6 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to aticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 8 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 8 hours of collection.

Performed:

Twice per week - variable days.

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

N/A

Synonyms:

- LAB759, ATG, AT3 Antigen, AT AG
- LAB759-VML
- LAB759VML

Performed:
Twice per week - variable days.

Turn Around Time:
1 - 6 days

Methodology:
Immunoturbidimetric

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
85 - 135%

Interpretive Data:
Cloudy or lipemic plasma may lead to an overestimation of the antithrombin antigen level. The presence of rheumatoid factor may lead to an overestimation of the AT level.

Methodology:
Immunoturbidimetric

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Performed daily from 7:00 AM to 4:00 PM. Sample must be received in the laboratory by 3:00 PM for same day testing. After hours testing must be approved by the Coagulation Laboratory Medical Direct on-call (refer to Synergy for contact information).

Components:

Apolipoprotein B/A Ratio

LAB3694

ORDERING INFO

Collect:
Serum separator tube, plasma separator tube, K2EDTA, lithium heparin

Synonyms:

- Apo B & A ratio
- Apolipoprotein A-1 & B
- Apolipoprotein A1 and B, Plasma
- Apolipoprotein A1 and B-100, Plasma
- Apolipoprotein APO A/B Ratio
- LAB3694-VML
- LAB3694VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Fasting specimen recommended.

Collect:
Serum separator tube, plasma separator tube, K2EDTA, lithium heparin

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP standard transport tube. (Min: 0.5 mL)

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 24 hours; Refrigerated: 8 days; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Apo B & A ratio
- Apolipoprotein A-1 & B
- Apolipoprotein A1 and B, Plasma
- Apolipoprotein A1 and B-100, Plasma
- Apolipoprotein APO A/B Ratio
- LAB3694-VML
- LAB3694VML

Ordering Recommendations:
Acceptable nontraditional secondary cardiovascular risk screen for specific populations.

Performed:
Sun-Sat

Methodology:
Quantitative Immunoturbidimetry

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Apolipoprotein B	Male: 55-140 mg/dL; Female: 55-125 mg/dL
Apolipoprotein A-1	Male: 94-178 mg/dL; Female: 101-199 mg/dL

Interpretive Data:

The ratio of apolipoprotein B/A can provide an estimate of the risk for major adverse cardiovascular events in adults.

Apolipoprotein B/A Ratio:	
Low Risk	0.2 - 0.6
Medium Risk	0.61 - 0.90
High Risk	0.91 - 5.0

Aquaporin-4 (AQP4) Antibody, IgG by CBA-IFA With Reflex to Titer, CSF

LAB3159

ORDERING INFO

Collect:
CSF.

Synonyms:

- AQP4
- Pediatric CNS disorders
- Aquaporin; Devic's Ab
- Cell-based assay
- Cell-binding assay
- Myelopathy
- AQP
- AQP4 antibody
- Neuromyelitis Optica (NMO) Antibody
- Neuromyelitis Optica IgG
- CNS demyelinating disease
- Devic's Antibody
- NMO-IgG
- NMOSD
- Optic Neuritis Ab
- Optic Neuritis Antibody
- Optic-Spinal MS Antibody
- Soft-NMOS
- Transverse Myelitis Ab
- Vision Loss Ab
- Aquaporin
- Devic's Ab
- LAB3159-VML
- LAB3159VML

SPECIMEN REQUIREMENTS

Collect:
CSF.

Specimen Preparation:
Transfer 0.5 mL CSF to an ARUP standard transport tube. (Min: 0.15 mL)

Unacceptable Conditions:
Hemolyzed, contaminated specimens or severely lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 48 hours; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Mon, Wed, Fri

ORDERING

Synonyms:

- AQP4
- Pediatric CNS disorders
- Aquaporin; Devic's Ab
- Cell-based assay
- Cell-binding assay
- Myelopathy
- AQP
- AQP4 antibody
- Neuromyelitis Optica (NMO) Antibody
- Neuromyelitis Optica IgG
- CNS demyelinating disease
- Devic's Antibody
- NMO-IgG
- NMOSD
- Optic Neuritis Ab
- Optic Neuritis Antibody
- Optic-Spinal MS Antibody
- Soft-NMOS
- Transverse Myelitis Ab
- Vision Loss Ab
- Aquaporin
- Devic's Ab
- LAB3159-VML
- LAB3159VML

Ordering Recommendations:
Useful in the initial evaluation of neuromyelitis optica (NMO) spectrum disorders. This test uses a cell-based assay (CBA) to detect antibodies against aquaporin-4.

Performed:
Mon, Wed, Fri

Methodology:
Semi-Quantitative Cell-Based Indirect Fluorescent Antibody

Reported:
1-6 days

Notes:
If AQP4 antibody IgG is positive, then an AQP4 antibody IgG titer is reported. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:
Less than 1:1

Interpretive Data:
Neuromyelitis optic (NMO) commonly presents with optic neuritis or longitudinally extensive transverse myelitis. Approximately 75% of patients with NMO have antibodies to the aquaporin-4 (AQP4) receptor. While the absence of AQP4 receptor antibodies does not rule out a diagnosis of NMO, presence of this antibody is diagnostic for NMO.

This indirect fluorescent antibody assay utilizes AQP4 receptor transfected cell lines for the detection and semiquantification of AQP4 IgG antibody.

Methodology:
Semi-Quantitative Cell-Based Indirect Fluorescent Antibody

Argatroban Level

LAB2308

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB2308, ARG, ANTI-IIa ASSAY, Argatroban Level
- LAB2308-VML
- LAB2308VML

Turn Around Time:

1 day

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hour

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Argatroban levels should only be ordered on patients who are receiving argatroban.

1 day

Methodology:
Chromogenic

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Normal reference range 0.00 mcg/mL. Argatroban levels of 0.40 to 1.50 mcg/mL correspond to a 1.5 to 2.5-fold increase of the baseline PTT.

Interpretive Data:
Argatroban interferes with clot-based assays and will result in test results that are greater than their actual value for the following assays: activated protein C resistance, clot-based protein C and S activity, thrombin-based (IIa) antithrombin assay, dilute Russell Viper venom time, and STAClot LA. Fibrinogen and factor activiy levels will be lower than their actual values.

Methodology:
Chromogenic

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
Performed daliy from 7:00 AM to 4:00 PM. The sample must by received in the laboratory by 3:00 PM for same day testing. After hours testing must by approved by the Coagulation Laboratory Medical Director on-call (refer to Synergy for contact information).

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:
Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:
Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Preferred Collection Volume:
Fill all tubes to indicator line.

Alternate Specimen:
N/A

Patient Preparation:
Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Specimen:
Citrated platelet poor plasma .

Reasons for Rejection:
Incorrect tube type, clotted, incorrect fill volume, received on ice, grossly hemolyzed, grossly icteric, grossly lipemic. Whole blood > 4 hours after collection. Thawed plasma aliquots.

Components:
N/A

Stability:
Ambient (15-25°C): 4 hour

Storage/Transport Temperature:
Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Synonyms:

- LAB2308, ARG, ANTI-IIa ASSAY, Argatroban Level
- LAB2308-VML
- LAB2308VML

Performed:
Daily

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
1 day

Ordering Indicators:
Argatroban levels should only be ordered on patients who are receiving argatroban.

Interpretive Data:
Argatroban interferes with clot-based assays and will result in test results that are greater than their actual value for the following assays: activated protein C resistance, clot-based protein C and S activity, thrombin-based (IIa) antithrombin assay, dilute Russell Viper venom time, and STAClot LA. Fibrinogen and factor activiy levels will be lower than their actual values.

Reference Interval:
Normal reference range 0.00 mcg/mL. Argatroban levels of 0.40 to 1.50 mcg/mL correspond to a 1.5 to 2.5-fold increase of the baseline PTT.

Additional Information:
Performed daliy from 7:00 AM to 4:00 PM. The sample must by received in the laboratory by 3:00 PM for same day testing. After hours testing must by approved by the Coagulation Laboratory Medical Director on-call (refer to Synergy for contact information).

Arsenic, Blood

LAB3696

ORDERING INFO

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Synonyms:

- ASB (Arsenic, Blood)
- As (Arsenic, Blood)
- LAB3696-VML
- LAB3696VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patient should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician) and avoid shellfish and seafood for 48 to 72 hours.

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Specimen Preparation:
Transport 6 mL whole blood in the original collection tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens collected in tubes other than Royal blue (K2EDTA) or Royal blue (NaHep).

Specimens transported in containers other than Royal blue (K2EDTA) or Royal blue (NaHep) tube or Trace Element-Free Transport Tube. Clotted specimens.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Trace Elements requisition form may be required (ARUP form #32990).

ORDERING

Synonyms:

- ASB (Arsenic, Blood)
- As (Arsenic, Blood)
- LAB3696-VML
- LAB3696VML

Ordering Recommendations:
May be useful for the detection of recent (<24 hours after exposure) and/or large dose arsenic exposures. For acute or chronic exposure, Arsenic, Urine with Reflex to Fractionated (0025000) is preferred.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 12.0 µg/L

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of blood arsenic, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Potentially toxic ranges for blood arsenic: Greater than or equal to 600 µg/L.

Blood arsenic is for the detection of recent exposure poisoning only. Blood arsenic levels in healthy subjects vary considerably with exposure to arsenic in the diet and the environment. A 24-hour urine arsenic is useful for the detection of chronic exposure.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Arsenic, Fractionated, Urine

LAB362

ORDERING INFO

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container and should be refrigerated during collection. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately if tested within 14 days of collection.

Synonyms:

- arsenic metabolites
- arsenic, inorganic forms
- arsenic, methylated forms
- Arsenic, organic forms
- As metabolites
- As, inorganic forms
- As, methylated forms
- As, organic forms
- ASFR
- LAB362-VML
- LAB362VML

SPECIMEN REQUIREMENTS

Collect:

24-hour or random urine collection. Specimen must be collected in a plastic container and should be refrigerated during collection. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately if tested within 14 days of collection.

Specimen Preparation:

Transfer an 8 mL aliquot of urine from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 2 mL)

Unacceptable Conditions:

Urine collected within 48 hours after administration of a gadolinium (Gd) containing contrast media (may occur with MRI studies). Acid preserved urine. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element-free transport tube (with the exception of the original device).

Storage/Transport Temperature:

Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):

Ambient: 2 weeks; Refrigerated: 2 weeks; Frozen: 2 months

Performed:

Tue, Fri

Remarks:

Record total volume and collection time interval on transport tube and on test request form.

ORDERING

Synonyms:

- arsenic, inorganic forms
- arsenic, methylated forms
- Arsenic, organic forms
- As metabolites
- As, inorganic forms
- As, methylated forms
- As, organic forms
- ASFR
- LAB362-VML
- LAB362VML

Ordering Recommendations:

Useful when exposure to arsenic is known but the species is uncertain. For initial testing, Arsenic, Urine with Reflex to Fractionated (0025000) is preferred.

Performed:

Tue, Fri

Methodology:
Quantitative High Performance Liquid Chromatography (HPLC)/Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-10 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
Arsenic, Organic	By report
Arsenic, Inorganic	By report
Arsenic, Methylated	By report

Interpretive Data:
The ACGIH Biological Exposure Index for the sum of inorganic and methylated species of arsenic is 35 µg/L. Inorganic species of arsenic are most toxic. Methylated species arise primarily from metabolism of inorganic species but may also come from dietary sources and are of moderate toxic potential. The organic species of arsenic are considered nontoxic and arise primarily from food. The sum of the inorganic, methylated, and organic species of arsenic may be lower than the total arsenic concentration due to the presence of unidentified organic species of arsenic.

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, nonessential over-the-counter medications (upon the advice of their physician), and avoid shellfish and seafood for 48 to 72 hours. High concentrations of iodine may interfere with elemental testing. Collection of urine specimens from patients receiving iodinated or gadolinium-based contrast media should be avoided for a minimum of 72 hours post-exposure. Collection from patients with impaired kidney function should be avoided for a minimum of 14 days post contrast media exposure.

Collect:
24-hour or random urine collection. Specimen must be collected in a plastic container and refrigerated during collection. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately if tested within 14 days of collection.

Specimen Preparation:
Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116) available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 2 mL)

Unacceptable Conditions:
Acid preserved urine. Specimens collected within 72 hours after administration of iodinated or gadolinium-based contrast media. Specimens contaminated with blood or fecal material. Specimens transported in non-trace element-free transport tube (with the exception of the original device).

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

Remarks:
Trace Elements requisition form may be required (ARUP form #32990-Barcode; #32991-No Barcode).

ORDERING

Synonyms:

- As
- ASU
- Normalized Urine As, Normalized Urine Arsenic
- Arsenic/Creatinine Ratio, Random, Urine
- LAB361-VML
- LAB361VML

Ordering Recommendations:
Preferred test for the assessment of acute or chronic arsenic exposure. This test is able to differentiate between toxic inorganic and methylated species as well as benign organic forms. Results are reported as total inorganic, total methylated, and organic arsenic

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography/Quantitative Inductively Coupled Plasma-Mass Spectrometry

Reported:
1-5 days

Notes:
If total arsenic concentration is found to be elevated based on reference intervals, then Arsenic, Fractionated, will be added to determine the proportion of organic, inorganic, and methylated forms. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

<table>
<tr><th>Components</th><th>Reference Interval</th></tr>
<tr><td>Creatinine, Urine - per 24h</td><td>
<table>
<tr><th>Age</th><th>Male (mg/d)</th><th>Female (mg/d)</th></tr>
<tr><td>3-8 years</td><td>140-700</td><td>140-700</td></tr>
<tr><td>9-12 years</td><td>300-1300</td><td>300-1300</td></tr>
<tr><td>13-17 years</td><td>500-2300</td><td>400-1600</td></tr>
<tr><td>18-50 years</td><td>1000-2500</td><td>700-1600</td></tr>
<tr><td>51-80 years</td><td>800-2100</td><td>500-1400</td></tr>
<tr><td>81 years and older</td><td>600-2000</td><td>400-1300</td></tr>
</table>
</td></tr>
<tr><td>Arsenic Urine - per volume</td><td>0.0-34.9 µg/L</td></tr>
<tr><td>Arsenic Urine - per 24h</td><td>0.0-49.9 µg/d</td></tr>
<tr><td>Arsenic, Urine - ratio to CRT</td><td>0.0-29.9 µg/g CRT</td></tr>
</table>

Interpretive Data:
The ACGIH Biological Exposure Index (BEI) for arsenic in urine is 35 µg/L. The ACGIH BEI is based on the sum of inorganic and methylated species. For specimens with elevated total arsenic results, fractionation is automatically performed to determine the proportions of inorganic, methylated and organic species.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Quantitative High Performance Liquid Chromatography/Quantitative Inductively Coupled Plasma-Mass Spectrometry

ASCITIC FLUID, PERITONEAL FLUID, ABDOMINAL FLUID CYTOLOGY

asc, pcfl

ORDERING INFO

Collect:
Clean specimen container.

Synonyms:

- Ascitic fluid, Paracentesis fluid, Peritoneal fluid, Abdominal fluid

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container.

Specimen Preparation:
1. Collect specimen in a clean specimen container (min 1 mL). 2.Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: 100ml is optimal)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours. Some specimens may have fixative added if specimen cannot be delivered within 2 hours and cannot be Refrigerated: (2-8°C) during transport. Call lab for assistance at 615-322-2721.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Fresh body cavity fluid specimen in a clean sample container.

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Body cavities in the absence of disease contain only a small amount of fluid. The presence of larger amounts in quantities for aspiration indicates a pathologic condition. Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc. 1U/mL of Heparin may be added if bloody.

Synonyms:

- Ascitic fluid, Paracentesis fluid, Peritoneal fluid, Abdominal fluid

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Methodology:
ThinPrep procedure

Aspartate Aminotransferase (AST), Plasma or Serum

LAB131

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- SGOT, Aspartate transaminase, LAB131
- LAB131-VML
- LAB131VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.2 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Room Temperature: 15° to 25°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 4 days; 2° to 8°C: 7 days; Frozen: 3 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Aspergillus Galactomannan Antigen by EIA, Serum or BAL

LAB6397

ORDERING INFO

Collect:

Serum: Red tube (no gel)

BAL: Sterile container

Synonyms:

- LAB6397, Aspergillus Galactomannan Antigen, Aspergillus Ag
- LAB6397-VML
- LAB6397VML

Turn Around Time:

1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:

NA

Collect:

Serum: Red tube (no gel)

BAL: Sterile container

Specimen Preparation:

Separate serum from cells ASAP, store refrigerated. Collect BAL, store refrigerated in a sterile container (Minimum 0.5 mL serum or BAL)

Pediatric Collection:

Two Red Microtainers (no gel) BAL in sterile container

Storage/Transport Temperature:
Refrigerated (2-8°C)

Performed:
Monday - Friday

Stability:
Refrigerated (2-8°C): 5 days

Specimen:
Serum or BAL

Alternate Specimen:
Serum: Gold SST tube (Clot activator with gel)

ORDERING

Ordering Indicators:
This test is used, in conjunction with other diagnostic procedures, to aid in the diagnosis of invasive aspergillosis.

Synonyms:

- LAB6397, Aspergillus Galactomannan Antigen, Aspergillus Ag
- LAB6397-VML
- LAB6397VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
Enzyme-linked Immunoassay

Components:
Aspergillus Galactomannan Ag; Aspergillus Galactomannan Ag Index

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive result supports a diagnosis of invasive aspergillosis (IA). Positive results should be considered in conjunction with other diagnostic procedures, such as microbiologic culture, histological examination of biopsy specimens, and radiographic evidence. A negative results do not exclude the diagnosis of invasive aspergillosis

Methodology:
Enzyme-linked Immunoassay

Bacterial culture, abscess

LAB3087

ORDERING INFO

Collect:

Sterile screw-top container

Synonyms:

- ABB, Anaerobe, Anaerobe culture, Culture abscess
- LAB3087-VML
- LAB3087VML

Turn Around Time:

Gram stain: 3 hours from receipt in laboratory. Culture: 1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Sterile screw-top container

Specimen Preparation:

(Min , 0.5 mL or 1 swab).

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient: (15-25°C)

Performed:

Daily

Stability:

Send to laboratory immediately. Ambient: (15-25°C) 24 hours.

Specimen:

Abscess: aspirate or purulent material. Specify source.

Alternate Specimen:
Purulent material collected on flocked swab and placed in eSwab transport (liquid amies).

ORDERING

Ordering Indicators:
N/A

Synonyms:

- ABB, Anaerobe, Anaerobe culture, Culture abscess
- LAB3087-VML
- LAB3087VML

Performed:
Daily

Turn Around Time:
Gram stain: 3 hours from receipt in laboratory. Culture: 1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

Methodology:
Aerobic and anaerobic culture and gram stain.

Components:
Gram stain, aerobic culture, anaerobic culture, identification and antimicrobial susceptibility testing.

RESULTS INTERPRETATION

Reference Interval:
No growth.

Interpretive Data:
Identification and suscesptibility tests are performed on significant isolates. Mixed cultures (3+ microorganisms) reported descriptively only. Plates held 4 days in case further testing needed, call laboratory.

Methodology:
Aerobic and anaerobic culture and gram stain.

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
Purulent material collected on flocked swab and placed in eSwab transport (liquid amies).

Additional Information:
Gram stain included with culture and has a separate charge. Culture includes aerobic and anaerobic culture. There will be separate charges for organism identification and susceptibility testing when appropriate.

Components:
Gram stain, aerobic culture, anaerobic culture, identification and antimicrobial susceptibility testing.

Resulting Laboratory:
Vanderbilt Medical Laboratories

ORDERING INFO

Collect:

Bactec Plus Aerobic/F bottle: 8-10 mL AND Bactec Lytic/10 anaerobic bottle: 8-10 mL

Synonyms:

- Blood culture, C Blood Adult, sepsis culture, BAB
- LAB462-VML
- LAB462VML

Turn Around Time:

5 days for negative cultures. Positives reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Bactec Plus Aerobic/F bottle: 8-10 mL AND Bactec Lytic/10 anaerobic bottle: 8-10 mL

Specimen Preparation:

Send to laboratory immediately following collection. (Min, 1 mL per bottle)

Pediatric Collection:

Refer to Bacterial culture, pediatric blood

Storage/Transport Temperature:

Ambient: (15-25°C)

Performed:

Daily

Stability:

Ambient: (15-25°C), 4 hours

Specimen:

Blood

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:
Assessment of bacterial sepsis/bacteremia.

Synonyms:

- Blood culture, C Blood Adult, sepsis culture, BAB
- LAB462-VML
- LAB462VML

Performed:
Daily

Turn Around Time:
5 days for negative cultures. Positives reported as soon as detected.

Methodology:
BACTEC FX, continuous monitoring system

Components:
Gram stain, ePlex® molecular identification and antimicrobial susceptibility testing.

RESULTS INTERPRETATION

Reference Interval:
No growth.

Bacterial Culture, Body Fluids

LAB269

ORDERING INFO

Collect:

Sterile screwtop container for Gram stain

and Bactec Aerobic PLUS bottle for culture.

Synonyms:

- BFB, Culture Bacterial Body Fluid, C Body Fluid, Anaerobe, Anaerobic
- LAB269-VML
- LAB269VML

Turn Around Time:

Gram stain: 3 hours after receipt in laboratory. Culture, 3-5 days to final. Positive results are reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

Collect prior to antimicrobial therapy to increase diagnostic yield.

Collect:
Sterile screwtop container for Gram stain

and Bactec Aerobic PLUS bottle for culture.

Specimen Preparation:
Submitting specimen in blood culture bottles may increase diagnostic yield. Submit BOTH blood culture bottle with fluid AND sterile container if both culture and Gram stain desired. (Min: 1 mL fluid in sterile container)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Ambient: (15-25°C), deliver to laboratory as soon as possible.

Specimen:
Body fluid, specify source

Alternate Specimen:
Sterile container

ORDERING

Ordering Indicators:
Assessment of suspected bacterial or Candida infection.

Synonyms:

- BFB, Culture Bacterial Body Fluid, C Body Fluid, Anaerobe, Anaerobic
- LAB269-VML
- LAB269VML

Performed:
Daily

Turn Around Time:
Gram stain: 3 hours after receipt in laboratory. Culture, 3-5 days to final. Positive results are reported as soon as detected.

Methodology:
Gram stain and aerobic and anaerobic culture.

Components:
Gram stain and bacterial (anaerobic and aerobic) culture. Identification and susceptibility testing as indicated.

RESULTS INTERPRETATION

Reference Interval:
No growth.

Interpretive Data:
Positive gram stain and cultures alerted to clinical team.

Methodology:
Gram stain and aerobic and anaerobic culture.

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
Sterile container

Additional Information:
Gram stain, identification and antimicrobial susceptibility testing included and have a separate charge from culture.

Components:
Gram stain and bacterial (anaerobic and aerobic) culture. Identification and susceptibility testing as indicated.

Resulting Laboratory:
Vanderbilt Medical Laboratories

Bacterial Culture, Bronchoalveolar lavage

LAB267

ORDERING INFO

Collect:

Sterile screw-top container

Synonyms:

- BRB, BAL Culture, C Resp
- LAB267-VML
- LAB267VML

Turn Around Time:

Gram stain: 3 hours from receipt in laboratory. Culture: 1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

Yield is improved if collected prior to starting antibiotics.

Collect:

Sterile screw-top container

Specimen Preparation:

Collect via bronchoscopy (Min: 1 mL)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient: (15-25°C) (Refrigerated: (2-8°C)

Performed:

Daily

Stability:

Ambient: (15-25°C), 4 hours. If transport delayed, Refrigerated: (2-8°C) up to 24 hours. Specimens received >4 hr after collection may result in decreased ability to recover fastidious pathogens such as S. pneumoniae or H. influenzae.

Specimen:
Bronchoalveolar lavage

Alternate Specimen:
Bronchial wash, bronchial brushing, mini-BAL

ORDERING

Ordering Indicators:
Assessment of lower respiratory tract bacterial infections.

Synonyms:

- BRB, BAL Culture, C Resp
- LAB267-VML
- LAB267VML

Performed:
Daily

Turn Around Time:
Gram stain: 3 hours from receipt in laboratory. Culture: 1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

Methodology:
Gram stain and aerobic culture.

Components:
Gram stain and bacterial culture.

RESULTS INTERPRETATION

Reference Interval:
Negative for pathogenic bacteria.

Interpretive Data:
N/A

Methodology:
Gram stain and aerobic culture.

Bacterial Culture, Pediatric Blood

LAB3089

ORDERING INFO

Collect:
Refer to Pediatric collection chart

Synonyms:

- BPB, Blood culture, C Bld
- LAB3089-VML
- LAB3089VML

Turn Around Time:
5 days for negative cultures. Positives reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Refer to Pediatric collection chart

Specimen Preparation:
Skin antisepsis is imperative to avoid contamination. Disinfect the venipuncture site with 2% chlorhexidine or 2% iodine tincture. Chlorhexidine is not recommended for children < 2 months old. Swab with disinfectant for 1 min, and allow to dry, prior to venipuncture. Do not collect from vein which intravenous solution is being delivered. Drawing blood from a port of an indwelling catheter should ONLY be done if poor access requires this practice. (Min 0.5 mL in Bactec Aerobic PLUS bottle)

Pediatric Collection:
Weight based blood collection. Refer to chart.

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Ambient: (15-25°C), 4 hours

Specimen:
Blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Assessment of suspected bacterial or Candida infection.

Bacterial culture, respiratory

LAB900

ORDERING INFO

Collect:

Sterile screwtop container

Synonyms:

- Sputum, Culture bacterial respiratory, tracheal, RSP
- LAB900-VML
- LAB900VML

Turn Around Time:

Gram stain: 3 hours from receipt in laboratory. Culture: 1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Sterile screwtop container

Specimen Preparation:

(Min, 0.5 mL)

Pediatric Collection:

N/A

Storage/Transport Temperature:

Ambient: (15-25°C)

Performed:

Daily

Stability:

Send to laboratory immediately. Ambient: (15-25°C) 2 hours; Refrigerated: (2-8°C) 24 hours.

Specimen:

Sputum

Alternate Specimen:
Throat

ORDERING

Ordering Indicators:
N/A

Synonyms:

- Sputum, Culture bacterial respiratory, tracheal, RSP
- LAB900-VML
- LAB900VML

Performed:
Daily

Turn Around Time:
Gram stain: 3 hours from receipt in laboratory. Culture: 1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

Methodology:
Gram stain and aerobic bacterial culture.

Components:
Gram

RESULTS INTERPRETATION

Reference Interval:
Negative for pathogenic bacteria.

Interpretive Data:
The number of microbial species associated with CF lung disease is relatively limited. Emphasis is placed on the recovery of mucoid and nonmucoid Pseudomonas aeruginosa, Staphylococcus aureus (including smallcolony variants and methicillin-resistant strains), specific members of the Burkholderia cepacia complex, Stenotrophomonas maltophilia, Achromobacter spp., and other potential pathogens

Methodology:
Gram stain and aerobic bacterial culture.

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
Throat

Additional Information:
Gram stain included with culture for non-CF cultures and has a separate charge. There will be separate charges for organism identification and susceptibility testing when appropriate.

Components:
Gram

Bacterial culture, Respiratory Cystic Fibrosis

LAB3091

ORDERING INFO

Collect:

Collect throat swab with flocked swab and place in Eswab (liquid Amies) transport media.

Submit fluid in screwtop, sterile container.

Synonyms:

- CF culture, C Resp, CTB
- LAB3091-VML
- LAB3091VML

Turn Around Time:

3-5 days. Positives are reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

This test is only for Cystic Fibrosis Patients

Collect:

Collect throat swab with flocked swab and place in Eswab (liquid Amies) transport media.

Submit fluid in screwtop, sterile container.

Specimen Preparation:

(Min, 1 swab, 0.5 mL fluid)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C)

Performed:
Daily

Stability:
Ambient: (15-25°C), 24 hours

Specimen:
Throat or respiratory secretions

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Evaluation of respiratory exacerrbation or annual surveillance for patients with Cystic Fibrosis.

Synonyms:

- CF culture, C Resp, CTB
- LAB3091-VML
- LAB3091VML

Performed:
Daily

Turn Around Time:
3-5 days. Positives are reported as soon as detected.

Methodology:
Aerobic bacterial culture.

Components:
Culture, identification and susceptibility testing

RESULTS INTERPRETATION

Reference Interval:
No pathogens detected.

Interpretive Data:
The CF throat workup includes culturing for Pseudomonas aeruginosa, Staphylococcus aureus, Burkholderia cepacia, Stenotrophomonas maltophilia, and other potential pathogens.

Methodology:
Aerobic bacterial culture.

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
N/A

Additional Information:

Bacterial Culture, Stool

LAB223

ORDERING INFO

Collect:
Leak-proof, sterile screwtop container or Carey-Blair transport.

Synonyms:

- Culture, stool
- E. coli O157:H7 culture Enteric Pathogens Culture, Stool Feces Culture, Routine, STB
- LAB223-VML
- LAB223VML

Turn Around Time:
1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Leak-proof, sterile screwtop container or Carey-Blair transport.

Specimen Preparation:
Submit specimen in the accute stage of infection (usually 5-7 days). Send to laboratory immediately. If delay >2 h, use Cary-Blair transport medium. (Min: 1 mL liquid stool).

Pediatric Collection:
Rectal swab may be collected if stool specimen is not available for pediatric patients. However, culture sensitivity is reduced and a stool specimen should be submitted for culture when available.

Storage/Transport Temperature:
Ambient: (15-25°C) (fresh) Refrigerated: (2-8°C) (preserved).

Performed:
Daily

Stability:
Ambient: (15-25°C) 2 hours unpreserved. Refrigerated: (2-8°C) 24 hours, in Carey-Blair preservative.

Specimen:
Stool

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Preferred test for suspected bacterial diarrhea evaluation. Testing includes cultures for Salmonella, Shigella, Campylobacter, E. coli O157:H7. Can be used to rule out Aeromonas and Plesiomonas, specify the pathogen to rule out. For C. difficile testing, refer to C. difficile DNA by PCR (LAB 1053). For evaluation of an expanded panel of bacteria, viral and parasitic causes of gastroenteritis, refer to PCR Gastrointestinal (GI) Pathogen Panel (LAB 5886).

Synonyms:

- Culture, stool
- E. coli O157:H7 culture Enteric Pathogens Culture, Stool Feces Culture, Routine, STB
- LAB223-VML
- LAB223VML

Performed:
Daily

Turn Around Time:
1-5 days. Final negative result reported at 3 days. Positive culture reported as soon as detected.

Methodology:
Aerobic culture

Components:
Culture

RESULTS INTERPRETATION

Reference Interval:
Negative for Salmonella, Shigella, Campylobacter and E. coli O157:H7

Interpretive Data:
A positive culture result indicates infection with the identified organism. A negative culture does not rule out infection; sensitivity may be enhanced by submitting additional specimens, collected 3 days apart. Antimicrobial susceptibility testing performed on request, but not routinely.

Methodology:
Aerobic culture

ADDITIONAL INFORMATION

Section:
Microbiology

Alternate Specimen:
N/A

Additional Information:
Identification and antimicrobial susceptibiltiy tests billed seperately from culture. Stool culture includes culture for Salmonella, Shigella, Campylobacter, and E. coli O157:H7. If an isolate requires testing for Shiga-like toxin, this is billed seperately.

Components:
Culture

Resulting Laboratory:
Vanderbilt Medical Laboratories

Bacterial Culture, Urine

LAB239

ORDERING INFO

Collect:

Boric Acid transport tube (gray top, BD vacutainer).

Synonyms:

- Urine culture, C Urine, URB, urinalysis with reflex to culture
- LAB239-VML
- LAB239VML

Turn Around Time:

1-4 days. Final negative result reported at 2 days. Positive culture reported as soon as detected.

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Boric Acid transport tube (gray top, BD vacutainer).

Specimen Preparation:

Proper specimen collection is imperative to avoid contamination. Prior to collection, wash vuvla thoroughly using cleansing towlettes (female) or wash the glans penis thoroughly with two succesive cleansing towlettes (uncircumsised male), paying close attention to urethral meatus. Have patient collect voided urine directly into sterile, leakproof container in midstream. Transfer to Boric Acid vacutainer, filling with urine to minimum fill line (Min: 3 mL).

Pediatric Collection:

Do not place <3 mL in boric acid transport as this will inhibit bacterial growth. Submit in sterile container, refrigerated, as soon as possible.

Storage/Transport Temperature:

Ambient: (15-25°C) (Refrigerated: (2-8°C)

Performed:

Daily

Stability:

Boric acid tube: Ambient: (15-25°C) 48 hours. Sterile container: Ambient: (15-25°C) 2 hours, Refrigerated: (2-8°C) for 24 hours.

Specimen:

Urine, midstream, catheterized, cystoscopic, or suprapubic. Indicate source of specimen.

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:
Quantitative culture to identify bacterial causes of urinary tract infections

Synonyms:

- Urine culture, C Urine, URB, urinalysis with reflex to culture
- LAB239-VML
- LAB239VML

Performed:
Daily

Turn Around Time:
1-4 days. Final negative result reported at 2 days. Positive culture reported as soon as detected.

Methodology:
Quantitative aerobic culture. Gram stain not included.

Components:
Bacterial culture (quantitative).

RESULTS INTERPRETATION

Reference Interval:
Negative

Interpretive Data:
A positive culture may indicate infection or asymptomatic bacteriuria. Should only be performed on patients with >5 WBC on urinalysis, with selected exclusions (e.g., patient with absolute neutrophil count <500, pregnant patient).

Methodology:
Quantitative aerobic culture. Gram stain not included.

Ambient (15-25°C): 30 days

Specimen:

Vaginal

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
The Aptima® BV assay is an in vitro nucleic acid amplification test that utilizes real time transcription-mediated amplification (TMA) for detection and quantitation of ribosomal RNA from bacteria associated with bacterial vaginosis (BV), including Lactobacillus (L. gasseri, L. crispatus, and L. jensenii), Gardnerella vaginalis, and Atopobium vaginae. The assay reports a qualitative result for BV and does not report results for individual organisms. The assay is intended to aid in the diagnosis of BV on the automated Panther® system using clinician-collected and patient-collected vaginal swab specimens from females with a clinical presentation consistent with vaginitis and/or vaginosis.

Barbiturates, Serum or Plasma, Quantitative

LAB3701

ORDERING INFO

Collect:
Gray (sodium fluoride/potassium oxalate). Also acceptable: Plain red, green (sodium heparin), lavender (EDTA), or pink (K2EDTA).

Synonyms:

- Pain Management
- Sandoptal
- Seconal
- Amobarbitone
- Amytal
- Axocet
- Butalbital
- Fioricet
- Fiorinal
- Luminal
- Nembutal
- Phenobarbital
- Phenobarbitone
- Quinalbartbitone
- Pentobarbital
- Solfoton
- Tuinal
- LAB3701-VML
- LAB3701VML

SPECIMEN REQUIREMENTS

Collect:
Gray (sodium fluoride/potassium oxalate). Also acceptable: Plain red, green (sodium heparin), lavender (EDTA), or pink (K2EDTA).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 3.5 mL serum or plasma to an ARUP standard transport tube. (Min: 1.5 mL)

Unacceptable Conditions:
Separator tubes. Plasma or whole blood collected in light blue (sodium citrate). Specimens exposed to repeated freeze/thaw cycles. Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 3 years

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- Pain Management
- Sandoptal
- Seconal
- Amobarbitone
- Amytal
- Axocet
- Butalbital
- Fioricet
- Fiorinal
- Luminal
- Nembutal
- Phenobarbital
- Phenobarbitone
- Quinalbartbitone
- Pentobarbital
- Solfoton
- Tuinal
- LAB3701-VML
- LAB3701VML

Ordering Recommendations:
Use to optimize dosing and monitor patient adherence. Useful for ruling out barbiturate exposure. For follow-up testing of a presumptive result, the preferred test is Barbiturates, Urine, Quantitative (2012213).

Performed:
Tue, Thu, Sat

Methodology:
Quantitative Gas Chromatography-Mass Spectrometry/Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-7 days

RESULTS INTERPRETATION

Reference Interval:

Drugs Covered	Cutoff Concentrations
Butalbital	50 ng/mL
Pentobarbital	50 ng/mL
Phenobarbital	50 ng/mL

Interpretive Data:
Methodology: Quantitative Gas Chromatography-Mass Spectrometry/Quantitative Liquid Chromatography-Tandem Mass Spectrometry.

Positive cutoff: 50 ng/mL

For medical purposes only; not valid for forensic use.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

BCR-ABL1 Mutation Analysis for Tyrosine Kinase Inhibitor Resistance by Next Generation Sequencing

LAB5856

ORDERING INFO

Collect:
Lavendar (EDTA) or bone marrow (EDTA).

Synonyms:

- ABL Mutation (BCR-ABL1 Kinase Domain Mutation Analysis)
- ABL1 Mutation Analysis for Imatinib (BCR-ABL1 Kinase Domain Mutation Analysis)
- BCR-ABL1 Domain Mutation Analysis
- BCR-ABL1 Mutation (BCR-ABL1 Domain Mutation Analysis)
- Gleevec Resistance Mutation Analysis (BCR-ABL1 Kinase Domain Mutation Analysis)
- Imatinib Mesylate Resistance Analysis (BCR-ABL1 Kinase Domain Mutation)
- Imatinib Resistance Analysis (BCR-ABL1 Kinase Domain Mutation Analysis)
- TKI Therapy Resistance
- LAB5856-VML
- LAB5856VML

SPECIMEN REQUIREMENTS

Collect:
Lavendar (EDTA) or bone marrow (EDTA).

Specimen Preparation:
Transport 5 mL whole blood or 3 mL bone marrow. (Min: 1 mL)

Unacceptable Conditions:
Serum or plasma. Specimens collected in anticoagulants other than EDTA. Frozen Specimens. Clotted or serverely hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 1 hour; Refrigerated: 48 hours; Frozen: Unacceptable

Performed:
Varies

ORDERING

Synonyms:

- ABL Mutation (BCR-ABL1 Kinase Domain Mutation Analysis)
- ABL1 Mutation Analysis for Imatinib (BCR-ABL1 Kinase Domain Mutation Analysis)
- BCR-ABL1 Domain Mutation Analysis
- BCR-ABL1 Mutation (BCR-ABL1 Domain Mutation Analysis)
- Gleevec Resistance Mutation Analysis (BCR-ABL1 Kinase Domain Mutation Analysis)
- Imatinib Mesylate Resistance Analysis (BCR-ABL1 Kinase Domain Mutation)
- Imatinib Resistance Analysis (BCR-ABL1 Kinase Domain Mutation Analysis)
- TKI Therapy Resistance
- LAB5856-VML
- LAB5856VML

Ordering Recommendations:
Order only for patients with an established diagnosis of a BCR-ABL1-positive leukemia. Use to determine if a variant is present that would interfere with response to TKI therapy in Philadelphia chromosome positive (Ph+) lymphoblastic leukemia or chronic myelogenous leukemia (CML). Detects all common mutations, including T315I. For initial BCR-ABL1 testing, refer to Diagnostic Qualitative BCR-ABL1 Assay with Reflex to p190 or p210 Quantitative Assays (3005839).

Performed:
Varies

Methodology:
Massively Parallel Sequencing

Reported:
10-12 days

RESULTS INTERPRETATION

Interpretive Data:
Refer to report

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Massively Parallel Sequencing

Benzodiazepines, Urine, Quantitative

LAB6106

ORDERING INFO

Collect:
Random urine.

Synonyms:

- LAB6106-VML
- LAB6106VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 0.5 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 0.3 mL)

Unacceptable Conditions:
Specimens exposed to repeated freeze/thaw cycles.

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years

Performed:
Sun-Sat

ORDERING

Synonyms:

- LAB6106-VML
- LAB6106VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Benzodiazepines Urine Screen with Reflex to Quantitation (2012225).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Compare to Pain Management, Benzodiazepines, Quantitative, w/ medMATCH, Urine (Drugs of Abuse Confirmation/Quantitation - Benzodiazepines - Urine); Pain Management, Benzodiazepines, w/Confirmation w/med MATACH, Urine (Drugs of Abuse Confirmation/Quantitation - Benzodiazepines - Urine).

RESULTS INTERPRETATION

Reference Interval:

Drugs Covered	Cutoff Concentrations
Alprazolam	5 ng/mL
Alpha-hydroxyalprazolam	5 ng/mL
Chlordiazepoxide	20 ng/mL
Clonazepam	5 ng/mL
7-aminoclonazepam	5 ng/mL
Diazepam	20 ng/mL
Lorazepam	20 ng/mL
Midazolam	20 ng/mL
Alpha-hydroxymidazolam	20 ng/mL
Nordiazepam	20 ng/mL
Oxazepam	20 ng/mL
Temazepam	20 ng/mL

Interpretive Data:

Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Drugs covered: alprazolam, alpha-hydroxyalprazolam, chlordiazepoxide, clonazepam, 7-aminoclonazepam, diazepam, lorazepam, midazolam, alpha-hydroxymidazolam, nordiazepam, oxazepam and temazepam..

Positive cutoff: 20 ng/mL unless specified below:
Alprazolam: 5 ng/mL
Alpha-hydroxyalprazolam: 5 ng/mL
Clonazepam: 5 ng/mL
7-aminoclonazepam: 5 ng/mL

For medical purposes only; not valid for forensic use.

Identification of specific drug(s) taken by specimen donor is problematic due to common metabolites, some of which are prescription drugs themselves. The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Beta hCG, Plasma or Serum (Pregnancy)

LAB143

ORDERING INFO

Collect:
Red tube (no gel)

Synonyms:

- BHC, HCG, Beta-Human Chorionic Gonadotropin Serum, Beta hCG Blood, LAB143
- LAB143-VML
- LAB143VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Red tube (no gel)

Specimen Preparation:
Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.5 mL)

Pediatric Collection:
1 Red Microtainer (No Gel)

Storage/Transport Temperature:
Refrigerated: 2° to 8°C

Performed:
Daily

Stability:
After separation from cells: 2° to 8°C: 7 days; Frozen: 12 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

ORDERING

Ordering Indicators:
Beta hCG may be used to diagnose and monitor pregnancy. Patient results determined by assays using different manufacturers for methods may not be comparable.

Synonyms:

- BHC, HCG, Beta-Human Chorionic Gonadotropin Serum, Beta hCG Blood, LAB143
- LAB143-VML
- LAB143VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Chemiluminescent Immunoassay

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Males: 0-70 years: 0-4mIU/mL; Females (non-pregnant): 0-55 years: 0-5 mIU/mL

Beta-2 Glycoprotein 1 Antibodies, IgG and IgM

LAB1179

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB1179, B2GPI, Anti-Beta 2 Glycoprotein antibodies, Anti-Beta 2GP1, BGP
- LAB1179-VML
- LAB1179VML

Turn Around Time:

2 to 6 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 8 hours of collection. If sending plasma aliquots, double centrifugation is required. Transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within two hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 8 hours of collection.

Performed:

Twice weekly, variable days.

Stability:

Refrigerated (2-8°C): 8 hours, frozen at -70C: 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Beta 2 glycoporetein 1 antibodies should be ordered as a part of an assessment for antiphospholipid antibody syndrome.

Synonyms:

- LAB1179, B2GPI, Anti-Beta 2 Glycoprotein antibodies, Anti-Beta 2GP1, BGP
- LAB1179-VML
- LAB1179VML

Performed:
Twice weekly, variable days.

Turn Around Time:
2 to 6 days

Methodology:
ELISA (Enzyme-linked Immunosorbent Assay)

Components:
Anti-Beta 2 Glycoprotein IgG and IgM

RESULTS INTERPRETATION

Reference Interval:
< 20 G or M Units

Interpretive Data:
The persistent presence of IgG and/or IgM beta 2 glycoprotein I (B2GPI) antibodies is a laboratory criterion for the diagnosis of antiphospholipid syndrome (APS). Persistence is defined as moderate or high levels (> 40) of IgG and/or IgM B2GPI antibodies detected in two or more specimens drawn at least 12 weeks apart. B2GPI results greater than 20 GU (IgG) and/or MU (IgM) are considered positive based on the cutoff values established for this test. International reference materials and consensus units for anti-B2GPI antibodies have not been established (Clin Chim Acta. 2012;413(1-2):358-60; Arthritis Rheum. 2012;64(1):1-10.). Strong clinical correlation is recommended for a diagnosis of APS.

Methodology:
ELISA (Enzyme-linked Immunosorbent Assay)

ADDITIONAL INFORMATION

Section:
Coagulation

Alternate Specimen:
N/A

Additional Information:
In-patient testing must by approved by the Coagulation Medical Director on-call (refer to Synergy for contact information). Request can be submitted using the following link: redcap.link/misc-coag .

Components:
Anti-Beta 2 Glycoprotein IgG and IgM

Beta-2 Microglobulin, Serum or Plasma

LAB49

ORDERING INFO

Collect:
Serum/plasma separator tube. Also acceptable: Green (lithium heparin), or pink (K_2EDTA or K_3EDTA).

Synonyms:

- B2 Microglobulin
- B2M, Serum
- Beta Microglobulin
- Microglobulin, Beta 2
- Beta-2-Microglobulin
- Serum B2M
- Serum beta-2 microglobulin
- LAB49-VML
- LAB49VML

SPECIMEN REQUIREMENTS

Collect:
Serum/plasma separator tube. Also acceptable: Green (lithium heparin), or pink (K_2EDTA or K_3EDTA).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
CSF (refer to Beta-2 Microglobulin, CSF, ARUP test code 0080054)

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 72 hours; Refrigerated: 72 hours; Frozen: 6 months

Performed:
Sun-Sat

Beta-2 Transferrin

LAB205

ORDERING INFO

Collect:

Aural or nasal fluid in sterile container. If there is enough secretion, the specimen is collected in a test tube. A specimen can also be obtained by specifically applied suction. Straining, increase in abdominal pressure, or performance of the Valsalva maneuver may result in an increase in drainage. Specimen kept refrigerated may be collected if there is slow or intermittent flow or fluid.

Synonyms:

- Transferrin B2
- Transferrin, Spinal Fluid
- CSF Leakage Detection
- B2 Transferrin
- CSF Specific Transferrin
- CSF-Specific Transferrin
- Desialated Transferrin
- Tau CSF Protein
- Cerebrospinal Fluid Leakage
- LAB205-VML
- LAB205VML

SPECIMEN REQUIREMENTS

Collect:

Aural or nasal fluid in sterile container. If there is enough secretion, the specimen is collected in a test tube. A specimen can also be obtained by specifically applied suction. Straining, increase in abdominal pressure, or performance of the Valsalva maneuver may result in an increase in drainage. Specimen kept refrigerated may be collected if there is slow or intermittent flow or fluid.

Specimen Preparation:

Transport 2 mL aural or nasal fluid in a tube without preservative. (Min: 1 mL aural or nasal fluid)

Storage/Transport Temperature:

Refrigerated.

Stability (from collection to initiation):

Ambient: 2 weeks; Refrigerated: 2 weeks; Frozen: 2 weeks

Performed:

Sun-Sat

ORDERING

Synonyms:

- Transferrin B2
- Transferrin, Spinal Fluid
- CSF Leakage Detection
- B2 Transferrin
- CSF Specific Transferrin
- CSF-Specific Transferrin
- Desialated Transferrin
- Tau CSF Protein
- Cerebrospinal Fluid Leakage
- LAB205-VML
- LAB205VML

Ordering Recommendations:

Aids in diagnosis of CSF leak.

Performed:

Sun-Sat

Methodology:

Qualitative Immunofixation Electrophoresis

Reported:

1-4 days

Notes:

The beta-2 transferrin protein assay by IFE methodology is not a reliable method for detecting human perilymph due to the low sensitivity of the assay.

RESULTS INTERPRETATION

Reference Interval:
None detected

Interpretive Data:
Detection of a beta-2 transferrin band by IFE is diagnostic for the presence of cerebrospinal fluid (CSF). This test is useful in the differential diagnosis for CSF otorrhea or CSF rhinorrhea. Beta-2 transferrin is not detected by this methodology in normal serum, tears, saliva, sputum, nasal, or aural fluid.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Qualitative Immunofixation Electrophoresis

Beta-2-Microglobulin, Urine

LAB4074

ORDERING INFO

Collect:
Random urine.

Synonyms:

- B2 microglobulin
- Beta-2 Microglobulin, Urine Occupational
- B2M, Urine Occupational
- Beta 2 Test
- LAB4074-VML
- LAB4074VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Void the urinary bladder, then drink a large glass of water (around 500 mL or 17 oz) and collect a urine specimen within 1 hour.

Collect:
Random urine.

Specimen Preparation:
Transfer one 3 mL aliquot from a well-mixed random collection to an ARUP Standard Transport Tube. (Min: 1 mL)
If pH is greater than 8, lower pH to 6-8 by adding 1M HCL. If pH less than 6, increase pH to 6-8 by adding 5% NaOH. Titrate with appropriate preservative until pH of 6-8 has been reached. Record the pH on the transport tube and test request form.

Storage/Transport Temperature:
Frozen

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 48 hours; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- B2 microglobulin
- Beta-2 Microglobulin, Urine Occupational
- B2M, Urine Occupational
- Beta 2 Test
- LAB4074-VML
- LAB4074VML

Ordering Recommendations:
Evaluate renal tubular damage. Monitor exposure to mercury and cadmium.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Effective February 18, 2014	
Components	**Reference Interval**
Beta-2-Microglobulin, Urine	0-300 µg/L
Beta-2-Microglobulin, ratio to CRT	0-300 µg/g CRT

Methodology:
Quantitative Chemiluminescent Immunoassay

Bicarbonate (HCO_3), Urine

LAB4075

ORDERING INFO

Collect:
Random urine in sealed container.

Synonyms:

- HC03 urine
- bicarbonate urine
- LAB4075-VML
- LAB4075VML

SPECIMEN REQUIREMENTS

Collect:
Random urine in sealed container.

Specimen Preparation:
Immediately upon collection, mix and transfer 4 mL urine to an ARUP Standard Transport Tube. (Min: 0.3 mL) Do not expose to air.

Unacceptable Conditions:
Room temperature or refrigerated specimens.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen: 1 month (unstable if thawed and refrozen)

Performed:
Sun-Sat

ORDERING

Synonyms:

- HC03 urine
- bicarbonate urine
- LAB4075-VML
- LAB4075VML

Performed:
Sun-Sat

Methodology:

Bile Acids, Fractionated and Total by LC-MS/MS

LAB3702

ORDERING INFO

Collect:
Plain red or serum separator tube.

Synonyms:

- Fractionated Bile Acids
- Bile Salts
- Chenodeoxycholic Acid
- Cholic Acid
- Deoxycholic Acid
- Ursodeoxycholic Acid (UDC)
- LAB3702-VML
- LAB3702VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should fast for a minimum of eight hours prior to specimen collection.

Collect:
Plain red or serum separator tube.

Specimen Preparation:
After clot formation, centrifuge specimen and pour off serum into a transport tube. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.2 mL)

Storage/Transport Temperature:
Refrigerated. Store specimen refrigerated or frozen.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 3 months

Performed:
Tue, Thu, Sat

ORDERING

Synonyms:

- Fractionated Bile Acids
- Bile Salts
- Chenodeoxycholic Acid
- Cholic Acid
- Deoxycholic Acid
- Ursodeoxycholic Acid (UDC)
- LAB3702-VML
- LAB3702VML

Ordering Recommendations:
Aids in the evaluation of liver function and intrahepatic cholestasis of pregnancy. Use to monitor patients on bile acid therapy. This assay is not useful for the diagnosis of inborn errors of bile acid metabolism.

Performed:
Tue, Thu, Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-6 days

Notes:
Reference intervals were derived using samples obtained after an overnight fast.

RESULTS INTERPRETATION

Reference Interval:

7 years and older:
Cholic acid (CA) 0-1.9 µmol/L
Chenodeoxycholic acid (CDC) 0-3.4 µmol/L
Deoxycholic acid (DCA) 0-2.5 µmol/L
Ursodeoxycholic acid (UDC) 0-1.0 µmol/L
Total 0-7.0 µmol/L

Interpretive Data:

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Bile Acids, Total

LAB693

ORDERING INFO

Collect:
Serum separator tube or plasma separator tube. Also acceptable : Lavender (EDTA), Green (Lithium heparin)

Synonyms:

- Bile Salts, Total
- Bile Acids, Total
- Cholylglycine
- LAB693-VML
- LAB693VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should fast for 8 hours prior to collection.

Collect:
Serum separator tube or plasma separator tube. Also acceptable : Lavender (EDTA), Green (Lithium heparin)

Specimen Preparation:
Allow specimen to clot completely at room temperature before centrifugation. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Body fluids. Hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Bile Salts, Total
- Bile Acids, Total
- Cholylglycine
- LAB693-VML
- LAB693VML

Ordering Recommendations:
Use to detect hepatobiliary dysfunction. Do not order to detect inborn errors of bile acid metabolism. May aid in diagnosis of intrahepatic cholestasis of pregnancy.

Allow specimen to clot completely at room temperature before centrifugation. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Patient Preparation:
Patient should fast for 8 hours prior to collection.

Unacceptable Conditions:
Body fluids. Hemolyzed specimens.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 3 months

Storage/Transport Temperature:
Refrigerated.

Synonyms:

- Bile Salts, Total
- Bile Acids, Total
- Cholylglycine
- LAB693-VML
- LAB693VML

Performed:
Sun-Sat

Resulting Laboratory:
ARUP Laboratories

Reported:
Within 24 hours

Ordering Recommendations:
Use to detect hepatobiliary dysfunction. Do not order to detect inborn errors of bile acid metabolism. May aid in diagnosis of intrahepatic cholestasis of pregnancy.

Interpretive Data:
Reference interval applies to fasting specimens.

Reference Interval:
0-10 µmol/L

Methodology:
Quantitative Enzymatic Assay

BILE DUCT BRUSH CYTOLOGY

ORDERING INFO

Collect:
Clean specimen container filled with saline or RPMI and cytobrush.

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container filled with saline or RPMI and cytobrush.

Specimen Preparation:
1. Bile duct cells are collected on a cytobrush and immediately placed in either a saline or RPMI container (min 1mL). 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source and laterality when completing the collection task in Epic. 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: Obtain as much as clinical judgement allows)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Material brushed from bile duct in saline or RPMI

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc.

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
ThinPrep procedure

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Methodology:
ThinPrep procedure

ADDITIONAL INFORMATION

Section:
Cytology

Alternate Specimen:
N/A

Additional Information:
FISH testing can be ordered as a reference test at time of collection, but must be collected in a separate vial with its own order.

FULL VIEW

Bilirubin, Direct, Serum or Plasma

LAB52

ORDERING INFO

Collect:
Light Green (Lithium Heparin with Gel)

Synonyms:

- CBR, Direct Bilirubin, Conjugated Bilirubin, Bilirubin Conjugated Blood, LAB52
- LAB52-VML
- LAB52VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Light Green (Lithium Heparin with Gel)

Specimen Preparation:
Protect from light during collection, storage and shipment. Separate plasma or serum from cells ASAP or within 2 hours of collection. If a serum sample is collected, allow the sample to clot completely at room temperature prior to centrifugation. (Min 0.3 mL)

Pediatric Collection:
1 Light Green Microtainer (Lithium Heparin with Gel)

Storage/Transport Temperature:
Room Temperature: 15° to 25°C

Performed:
Daily

Stability:
After separation from cells: 15° to 25°C: 2 days; 2° to 8°C: 7 days; Frozen: 3 months

Specimen:
Plasma or Serum

Alternate Specimen:
Red (No Gel)

Biotinidase, Serum (with Paired Normal Control)

LAB958

ORDERING INFO

Collect:
Plain red or serum separator tube (patient) AND plain red serum separator tube (control).

Synonyms:

- Biotin-amide amidohydrolase
- Biotinidase deficiency
- LAB958-VML
- LAB958VML

SPECIMEN REQUIREMENTS

Patient Preparation:
A control specimen needs to be sent with the patient specimen. The control specimen needs to be drawn from a normal, healthy individual who is not biologically related to the patient. Collect control specimen within 30 minutes of patient specimen.

Collect:
Plain red or serum separator tube (patient) AND plain red serum separator tube (control).

Specimen Preparation:
Separate serum from cells and freeze ASAP or within 2 hours of collection. Transfer 2 mL serum (patient) AND 2 mL serum (control) to individual ARUP Standard Transport Tubes. (Min: 0.2 mL (patient) AND 0.2 mL (control)). Label control tube as "Control for [patient name]".

Unacceptable Conditions:
Refrigerated or room temperature specimens. Specimens subjected to more than one freeze/thaw cycle.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered. Ship patient and control specimens together.

Stability (from collection to initiation):
After separation from cells: Ambient: 1 hour; Refrigerated: 1 hour; Frozen: 1 month

Performed:
Tue, Fri

ORDERING

Synonyms:

- Biotin-amide amidohydrolase
- Biotinidase deficiency
- LAB958-VML
- LAB958VML

Ordering Recommendations:
Initial biotinidase enzyme test to diagnose or rule out biotinidase deficiency.

Performed:
Tue, Fri

Methodology:
Spectrophotometry

Reported:
1-6 days

RESULTS INTERPRETATION

Reference Interval:
3.5-13.8 U/L

Interpretive Data:
This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:
Spectrophotometry

Bivalirudin Level

LAB6348

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB6348, N/A
- LAB6348-VML
- LAB6348VML

Turn Around Time:

1 - 3 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 4 hours of collection. If sending plasma aliquots, centrifuge and transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 4 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Performed:

Daily

Stability:

Ambient (15-25°C): 4 hours, Frozen (-70°C): 1 month

Specimen:

Citrated platelet poor plasma - requires double centrifugation if sending a plasma aliquot. Aliquot(s) must be frozen if not received by lab within 4 hours of collection.

Alternate Specimen:

BK Virus (BKV) by Quantitative PCR

LAB1374

ORDERING INFO

Collect:

Blood: Plasma Preparation Tube (PPT) [EDTA]

Urine: Sterile Container

Synonyms:

- LAB1374, BKV, BKV DNA Quant, Human Polyomavirus, BK Virus
- LAB1374-VML
- LAB1374VML

Turn Around Time:

72 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Blood: Plasma Preparation Tube (PPT) [EDTA]

Urine: Sterile Container

Specimen Preparation:
Blood: draw 4.0ml of whole blood (Plasma Preparation tube [EDTA]), deliver to lab within 24hrs at Ambient (15-25°C). Urine: Collect in sterile container and deliver to lab within 24hrs at Ambient (15-25°C) (Min 0.5mL Plasma), (Min 6mL Urine)

Pediatric Collection:
Preparation Tube (PPT) [EDTA]

Storage/Transport Temperature:
Blood: Ambient (15-25°C); Urine: Ambient (15-25°C)

Performed:
Monday - Friday

Stability:
Blood: Up to 24 hours at Ambient (15-25°C), 6 days at Refrigerated (2-8°C) once spun and plasma separated. Urine: 24 hours at Ambient (15-25°C), 7 days at Refrigerated (2-8°C) if transferred to a "Cobas PCR Urine kit".

Specimen:
Blood in a PPT tube (EDTA); Urine

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
Guidelines recommend regular monitoring for BKV in kidney transplant patients to identify patients at risk for PyVAN. Plasma testing for BKV viremia is recommended as part of the strategy to identify patients at increased risk for PyVAN, either as a confirmatory test for patients in hom BKV viruria is detected, or as the primary testing modality for routine screening. There are currently no recommendations for routine BKV monitoring for HSCT patients, and testing is recommended primarily for evaluation of patients with hematuria and clinical symptoms of cystitis

Synonyms:

- LAB1374, BKV, BKV DNA Quant, Human Polyomavirus, BK Virus
- LAB1374-VML
- LAB1374VML

Performed:
Monday - Friday

Turn Around Time:
72 Hours

Methodology:
PCR (Polymerase Chain Reaction)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not Detected

Interpretive Data:
The quantitative range of this assay is 1.33-8.00 log IU/mL (21.5-100,000,000 IU/mL) An interpretation of "Not Detected" does not rule out the presence of inhibitors or BKV DNA concentration below the level of detection of the assay. Care should be taken in the interpretation of any single viral load determination. International standardization has improved comparability of assay results across laboratories, but discrepancies still exist due to commutability issues with the standard.

Methodology:
PCR (Polymerase Chain Reaction)

SPECIMEN REQUIREMENTS

Collect:
Heparinized syringe

Specimen Preparation:
Collect whole blood in a heparized syringe at room temperature and transport to the lab within 30 minutes, tube must have no air spaces and must not be clotted (Min: 250ul)

Pediatric Collection:
Microtainers and pediatric bullets are unacceptable

Storage/Transport Temperature:
Room Temperature: 15° to 25°C

Performed:
Daily

Stability:
15° to 25°C: 30 Minutes

Specimen:
Arterial blood

Alternate Specimen:
N/A

ORDERING

Synonyms:

- ABG , LAB76
- LAB76-VML
- LAB76VML

Performed:
Daily

Turn Around Time:
30 Minutes After Collection

Methodology:
Ion-selevtive electrode, amperometric electrode, electrical conductivity, and optical absorbance

Components:
pH Art, pCO2 Art, pO2 Art, O2 Sat Art, BE Art, HCO3 Art

RESULTS INTERPRETATION

Reference Interval:
pH Art: 7.35-7.45; pCO2 Art: 35-48 mmHG; pO2 Art: 83-108 mmHG; O2Sat Art: 95-98; BE Art: -2.0-3.0; HCO3 Art: 21-28 mmol/L

Methodology:
Ion-selevtive electrode, amperometric electrode, electrical conductivity, and optical absorbance

ADDITIONAL INFORMATION

Section:
Misc Chemistry

Alternate Specimen:
N/A

Components:
pH Art, pCO2 Art, pO2 Art, O2 Sat Art, BE Art, HCO3 Art

Resulting Laboratory:

Bone Marrow Engraftment Studies, Whole Blood, Bone Marrow, Tissue

LAB3026

ORDERING INFO

Collect:

Blood or bone marrow: Lavender tube (EDTA); Buccal: 4 swabs

Synonyms:

- LAB3026, Chimerism Analysis, RFL
- LAB3026-VML
- LAB3026VML

Turn Around Time:

7 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Blood or bone marrow: Lavender tube (EDTA); Buccal: 4 swabs

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:

Two lavender microtainers (EDTA)

Storage/Transport Temperature:

EDTA and ACD-A tubes: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C); Paraffin block: Ambient (15-25°C); Buccal swab: Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

EDTA and ACD-A tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C; Paraffin block: indefinitely; Buccal swab: indefinitely

Specimen:

Blood, bone marrow, tissue, DNA

Alternate Specimen:

Yellow tube (ACD-A)

ORDERING

Ordering Indicators:

Bone marrow engraftment studies (BME) are used to evaluate the degree of chimerism (percentage of donor versus recipient cells) in post-transplant peripheral blood or bone marrow specimens. Standard BME studies require DNA genotyping of the recipient, donor, and post-transplant specimen for comparison.

Synonyms:

- LAB3026, Chimerism Analysis, RFL
- LAB3026-VML
- LAB3026VML

Performed:
Monday - Friday

Turn Around Time:
7 days

Methodology:
Analysis of DNA polymorphisms for identification of host and donor cells post transplantation by fluorescent PCR and evaluated by capillary electrophoresis

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
Analysis of DNA corresponding to 15 independently segregating polymorphic loci and 1 sex-specific locus for the identification of recipient versus donor cells post-transplantation. Results must be interpreted in the appropriate clinical context. Refer to report.

Methodology:
Analysis of DNA polymorphisms for identification of host and donor cells post transplantation by fluorescent PCR and evaluated by capillary electrophoresis

ADDITIONAL INFORMATION

Section:
Molecular Diagnostics

Bone Specific Alkaline Phosphatase

LAB1070

ORDERING INFO

Collect:
Serum separator tube. Also acceptable: Green (sodium or lithium heparin).

Synonyms:

- Alkaline Phosphatase
- Alkaline Phosphatase, Bone
- BAP
- Ostase
- Phosphatase
- Skeletal Alkaline Phosphatase
- LAB1070-VML
- LAB1070VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube. Also acceptable: Green (sodium or lithium heparin).

Specimen Preparation:
Transfer 0.5 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.3 mL)

Unacceptable Conditions:
Urine. Grossly hemolyzed specimens.

Storage/Transport Temperature:
FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: 2 hours; Refrigerated: 48 hours; Frozen: 2 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Alkaline Phosphatase
- Alkaline Phosphatase, Bone
- BAP
- Ostase
- Phosphatase
- Skeletal Alkaline Phosphatase
- LAB1070-VML
- LAB1070VML

Performed:
Sun-Sat

Methodology:
Quantitative Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:

Effective November 14, 2011

Age	Male	Female
6 months-2 years	31.6- 122.6 µg/L	33.4- 145.3 µg/L
3-6 years	31.3-103.4 µg/L	32.9-108.6 µg/L
7-9 years	48.6-140.4 µg/L	36.3-159.4 µg/L
10-12 years	48.8-155.5 µg/L	44.2-163.3 µg/L
13-15 years	27.8-210.9 µg/L	14.8-136.2 µg/L
16-17 years	15.3-126.8 µg/L	10.5-44.8 µg/L
18-24 years	10.0- 28.8 µg/L	
25 years and older	6.5-20.1 µg/L	
Premenopausal Female		4.5-16.9 µg/L
Postmenopausal Female		7.0-22.4 µg/L

Interpretive Data:

Liver alkaline phosphatase can affect the measurement of bone specific alkaline phosphatase in this assay. Each 100 U/L of liver alkaline phosphatase contributes an additional 2.5 to 5.8 µg/L to the bone specific alkaline phosphatase result.

Methodology:

Quantitative Immunoassay

Borrelia burgdorferi VlsE1/pepC10 Antibodies, CSF, Total by ELISA With Reflex to IgM and IgG by Immunoblot (Standard Two-Tier Testing, CSF)

LAB6618

ORDERING INFO

Collect:
CSF.
New York State Clients: CSF and serum separator tube (SST) or plain red. Serum specimen should be drawn within 24 hours of CSF collection.

Synonyms:

- Lyme Disease CSF Abs Reflex Panel
- LAB6618-VML
- LAB6618VML

SPECIMEN REQUIREMENTS

Collect:
CSF.
New York State Clients: CSF and serum separator tube (SST) or plain red. Serum specimen should be drawn within 24 hours of CSF collection.

Specimen Preparation:
Transfer 6 mL CSF to an ARUP standard transport tube. (Min: 2.5 mL)
New York State Clients: Transfer 2 mL CSF (Min: 1 mL) to an ARUP standard transport tube AND transfer 2 mL serum to an ARUP standard transport tube.

Unacceptable Conditions:
Bacterially contaminated, heat-inactivated, hemolyzed, or xanthochromic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 8 hours; Refrigerated: 2 weeks; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Lyme Disease CSF Abs Reflex Panel
- LAB6618-VML
- LAB6618VML

Ordering Recommendations:
Preferred CSF reflex panel for the workup of suspected neuroborreliosis.

Performed:
Sun-Sat

Methodology:
Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)/Qualitative Immunoblot

Reported:
1-4 days

Notes:
If VlsE1/pepC10 antibodies by ELISA is 0.91 IV or greater, then B. burgdorferi IgG antibody by immunoblot and IgM antibody by immunoblot will be added. Additional charges apply.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval
B. burgdorferi VlsE1/pepC10 Abs, CSF	0.90 IV or less

Interpretive Data:

The detection of antibodies to Borrelia burgdorferi in cerebrospinal fluid may indicate central nervous system infection. However, consideration must be given to possible contamination by blood or transfer of serum antibodies across the blood-brain barrier. Lyme disease diagnosis in serum is recommended prior to any CSF studies.

Component	Interpretation
B. burgdorferi VlsE1/pepC10 Abs, ELISA	0.90 IV or less: Negative; VlsE1 and pepC10 antibodies to B. burgdorferi not detected. 0.91-1.09 IV: Equivocal; repeat testing in 10-14 days may be helpful. 1.10 IV or greater: Positive; VlsE1 and pepC10 antibodies to B. burgdorferi detected.

Methodology:

Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)/Qualitative Immunoblot

ADDITIONAL INFORMATION

CPT Codes:

86618; if reflexed, add 86617 x2

Section:

RF-ARUP

Notes:

If VlsE1/pepC10 antibodies by ELISA is 0.91 IV or greater, then B. burgdorferi IgG antibody by immunoblot and IgM antibody by immunoblot will be added. Additional charges apply.

Semi-Quantitative Enzyme-Linked Immunosorbent Assay (ELISA)/Qualitative Immunoblot

Section:

RF-ARUP

CPT Codes:

86618; if reflexed, add 86617 x2

Notes:

If VlsE1/pepC10 antibodies by ELISA is 0.91 IV or greater, then B. burgdorferi IgG antibody by immunoblot and IgM antibody by immunoblot will be added. Additional charges apply.

BRAF (V600E) Mutation Analysis, Tissue, whole blood, bone marrow

LAB5655

ORDERING INFO

Collect:

Lavendar tube (EDTA)

Synonyms:

- LAB5655, V6A, V600E
- LAB5655-VML
- LAB5655VML

Turn Around Time:

10 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:

Lavendar tube (EDTA)

Specimen Preparation:

Specimen should be designated for MDL only, not shared with other labs or add-on testing. Curls and unstained slides should be cut 10 micron thick with two accompanying H&E stained slides cut before and after unstained slides or curls. Tissue blocks will be returned after testing. (Min 0.5mL whole blood)

Pediatric Collection:

N/A

Storage/Transport Temperature:

EDTA and ACD-A tubes: Ambient (15-25°C) or Refrigerated (2-8°C); paraffin block: Ambient (15-25°C); purified DNA: Refrigerated (2-8°C) or Frozen (-20°C)

Performed:

Once per week - variable days

Stability:

EDTA and ACD-A tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Paraffin block: indefinitely; Purified DNA: indefinitely at -70°C.

Specimen:

Paraffin embedded tissue, whole blood, bone marrow, purified DNA

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Assessment of BRAF V600E mutational status in certain neoplasms (e.g., colorectal cancer)

Synonyms:

- LAB5655, V6A, V600E
- LAB5655-VML
- LAB5655VML

Performed:

Once per week - variable days

Turn Around Time:
10 days

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of BRAF c.1799T>A (p.V600E); Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
This assay will detect the presence of the c.1799T>A (V600E) allele of BRAF with a sensitivity of approximately 1-2%.

Methodology:
Allele-specific PCR followed by capillary electrophoresis for detection of BRAF c.1799T>A (p.V600E); Laboratory Developed Test

(Min 0.5mL whole blood)

Pediatric Collection:
N/A

Preferred Collection Volume:
Paraffin embedded tissue: block, 5 unstained slides, or 5 curls; Blood or bone marrow: 4mL; Purified DNA: 1µg

Alternate Specimen:
N/A

Patient Preparation:
Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Specimen:
Paraffin embedded tissue, whole blood, bone marrow, purified DNA

Reasons for Rejection:
Insufficient tumor in tissue; Decalcified tissue may or may not yield interpretable results and is dependent on the degree of fixation during processing. An alternate tissue specimen is suggested if available. Client will be notified by Molecular Diagnostics Lab if specimen is rejected. Externally extracted DNA received for clinical testing will only be accepted from CLIA-certified laboratories or laboratories meeting equivalent requirements.

Components:
N/A

Stability:
EDTA and ACD-A tubes: Ambient (15-25°C): 2 days, Refrigerated (2-8°C)C: 7 days; Paraffin block: indefinitely; Purified DNA: indefinitely at -70°C.

BREAST FLUID, PERI-IMPLANT CYTOLOGY

ORDERING INFO

Collect:
Clean specimen container with RPMI

Turn Around Time:
4 Days

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Clean specimen container with RPMI

Specimen Preparation:
1. Collect specimen in a clean specimen container filled with RPMI(min 1 mL). 2. Place Epic order for Cytology Non-Gyn/FNA. 3. Indicate specimen source is peri-implant breast fluid to rule out breast implant associated anaplastic large cell lymphoma (BIA-ALCL) when completing the collection task in Epic (please include laterality). 4. Specimen vial is to be labeled with lab ready label. 5. Please send Epic requisition and specimen vial to the lab. (Minimum: 100 mL is optimal)

Pediatric Collection:
N/A

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours.

Performed:
Monday-Friday

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Specimen:
Specimen in clean specimen container with RPMI

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Must indicate the specimen is to rule out BIA-ALCL. Provide body site, need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc.

Performed:
Monday-Friday

Turn Around Time:
4 Days

Methodology:
Cell block or cytospin protocol with immunohistochemical stains (CD30)

RESULTS INTERPRETATION

Reference Interval:
Not established for this test

Interpretive Data:
This test is to determine the presence or absence of breast implant associated anaplastic large cell lymphoma

Methodology:
Cell block or cytospin protocol with immunohistochemical stains (CD30)

N/A

Stability:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) 6 days

Storage/Transport Temperature:
Ambient: (15-25°C) if delivered to lab within 2 hours of collection; Refrigerated: (2-8°C) if specimen cannot be in lab within 2 hours. Some specimens may have fixative added if specimen cannot be delivered within 2 hours and cannot be Refrigerated: (2-8°C) during transport. Call lab for assistance at 615-322-2721.

Synonyms:

- Bronchial washing, Bronchoalveolar lavage, BAL, BW

Performed:
Monday-Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
4 Days

Ordering Indicators:
Cytologic examination of specimens collected during fiberoptic bronchoscopy augment transbronchial biopsy specimens. Need patient history of prior or suspected malignancy; i.e., carcinoma, melanoma, lymphoma, etc. Special stains for fungus (GMS stain), AFB, lipid laden macrophages (Oil Red O), or hemosiderin laden macrophages (Iron stain) can be ordered if applicable.

Interpretive Data:
The cytologic examination of these specimens can determine the presence or absence of inflammation or tumor.

Reference Interval:
Not established for this test

Additional Information:
N/A

Methodology:
ThinPrep procedure

Section:
Cytology

B-Type Natriuretic Peptide, Plasma

LAB106

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- BNP, B-Type Natriuretic Peptide, Brain Natriuretic Peptide, LAB106
- LAB106-VML
- LAB106VML

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Transport at room temperature or 2° to 8°C. If testing will not be performed within 4 hours of collection, centrifuge plasma from cells, transfer 2 mL plasma into a transport tube and freeze. (Min 0.5 mL)

Pediatric Collection:
1 Lavender Microtainer (EDTA)

Storage/Transport Temperature:
Transport at Room Temperature: 15° to 25°C or Refrigerated: 2° to 8°C. If testing will not be performed within 4 hours of collection, centrifuge plasma from cells, transfer specimen into a transport tube and freeze.

Performed:
Daily

Stability:
Plasma and Whole Blood 15° to 25°C: 4 hrs; Plasma 2° to 8°C: 24hrs ; Plasma Frozen: 3 months

Specimen:
Plasma

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
Aids in diagnosis, prognosis, and management of acute and chronic heart failure.

Synonyms:

- BNP, B-Type Natriuretic Peptide, Brain Natriuretic Peptide, LAB106
- LAB106-VML
- LAB106VML

Performed:
Daily

Turn Around Time:
STAT: 1 Hour, Routine: 2 Hours

Methodology:
Chemiluminescent Immunoassay

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
10-100 pg/mL

Interpretive Data:
A cutoff of 100 pg/mL has been demonstrated to provide the maximal combination of sensitivity, specificity, and negative predictive value for contributing to the diagnosis of congestive heart failure (CHF). A BNP value greater than 100 pg/mL is consistent with a diagnosis of CHF in the appropriate clinical setting. False-positive results are more common in females greater than 75 years of age. Blood concentrations of natriuretic peptides may also be elevated in patients with myocardial infarction and in patients who are candidates for or are undergoing renal dialysis.

Methodology:
Chemiluminescent Immunoassay

Buffy Coat Smears for Microorganims

LAB3431

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- BCM, Buffy Coat, Buffy Coat Smears for Microorganisms, PBS for microorganisms
- LAB3431-VML
- LAB3431VML

Turn Around Time:
1 day

SPECIMEN REQUIREMENTS

Patient Preparation:
N/A

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Collection for WBC concentration, draw 4ml whole blood EDTA for best concentration of WBCs (Min. 4ml whole blood)

Pediatric Collection:
Pediatric: 2mL EDTA 2K whole blood minimum

Storage/Transport Temperature:
Room Temperature or refrigerated

Performed:
Daily

Stability:
Room temperature or refrigerated

Specimen:
Whole Blood

Alternate Specimen:
N/A

ORDERING

Ordering Indicators:
This test is to concentrate the white cells to look for intracellular organisms in the peripheral blood. Do NOT order this test for malaria or babesia; order the Malaria Prep (thick and thin peripheral smear) instead

Synonyms:

- BCM, Buffy Coat, Buffy Coat Smears for Microorganisms, PBS for microorganisms
- LAB3431-VML
- LAB3431VML

Performed:
Daily

Turn Around Time:
1 day

Methodology:
Wright Stained peripheral smears and buffy coat smears

Components:
Separate written report generated by hematopathologist

RESULTS INTERPRETATION

Reference Interval:
Negative for organisms

Interpretive Data:
A low WBC count will not produce adequate buffy coat

Buprenorphine and Metabolites, Urine, Quantitative

LAB4076

ORDERING INFO

Collect:
Random urine.

Synonyms:

- Narcan
- Pain Management
- Sublocade
- Suboxone
- Subutex
- Transtec
- Vetergesic
- Zubsolv
- Belbuca
- Buprenex
- Butrans
- Medication Adherence
- Opioids use disorders
- Probuphine
- Temgesic
- LAB4076-VML
- LAB4076VML

SPECIMEN REQUIREMENTS

Collect:
Random urine.

Specimen Preparation:
Transfer 2 mL urine with no additives or preservatives to an ARUP standard transport tube. (Min: 1 mL)

Storage/Transport Temperature:
Room temperature.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 1 month; Frozen: 3 years (Avoid repeated freeze/thaw cycles)

Performed:
Sun-Sat

ORDERING

Synonyms:

- Narcan
- Pain Management
- Sublocade
- Suboxone
- Subutex
- Transtec
- Vetergesic
- Zubsolv
- Belbuca
- Buprenex
- Butrans
- Medication Adherence
- Opioids use disorders
- Probuphine
- Temgesic
- LAB4076-VML
- LAB4076VML

Ordering Recommendations:
Use to obtain quantitative results or to follow up a presumptive result. For general screening, the preferred test is Buprenorphine, Urine Screen with Reflex to Quantitation (2012273).

Performed:
Sun-Sat

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Effective August 17, 2015

Drugs Covered	Cutoff Concentrations
Buprenorphine	2 ng/mL
Norbuprenorphine	2 ng/mL
Buprenorphine glucuronide	5 ng/mL
Norbuprenorphine glucuronide	5 ng/mL
Naloxone	100 ng/mL

Interpretive Data:
Methodology: Quantitative Liquid Chromatography-Tandem Mass Spectrometry

Positive cutoff:
Buprenorphine: 2 ng/mL
Norbuprenorphine: 2 ng/mL
Buprenorphine glucuronide: 5 ng/mL
Norbuprenorphine glucuronide: 5 ng/mL
Naloxone: 100 ng/mL

For medical purposes only; not valid for forensic use.

The presence of metabolite(s) without parent drug is common and may indicate use of parent drug during the prior week. Naloxone is included to detect the addition of a naloxone-containing drug directly into the urine.

The absence of expected drug(s) and/or drug metabolite(s) may indicate noncompliance, inappropriate timing of specimen collection relative to drug administration, poor drug absorption, diluted/adulterated urine, or limitations of testing. The concentration value must be greater than or equal to the cutoff to be reported as positive. Interpretive questions should be directed to the laboratory.

Methodology:
Quantitative Liquid Chromatography-Tandem Mass Spectrometry

C1-Esterase Inhibitor

LAB850

ORDERING INFO

Collect:
Serum separator tube.

Synonyms:

- C1 Inhibitor Antigenic Protein
- C1 esterase inhibitor
- C1 Esterase Inhibitor Antigen, S
- C1 Esterase Inhibitor Antigen, Serum
- C1 Esterase Inhibitor Quantitative
- C1 Inactivator, Quantitative
- C1 Inhibitor
- C1 inhibitor level
- HAE
- Hereditary Angioedema
- LAB850-VML
- LAB850VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube.

Specimen Preparation:
Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Ambient. Grossly hemolyzed and/or lipemic specimens

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 14 days; Frozen: 1 month.

Performed:
Sun-Sat

Cadmium, Blood

LAB3710

ORDERING INFO

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Synonyms:

- Blood concentration, cadmium
- Cd
- CDB
- LAB3710-VML
- LAB3710VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, non-essential over-the-counter medications (upon the advice of their physician).

Collect:
Royal blue (K2EDTA) or Royal blue (NaHep).

Specimen Preparation:
Transport 6 mL whole blood in the original collection tube. (Min: 0.5 mL)

Unacceptable Conditions:
Specimens collected in tubes other than Royal blue (K2EDTA) or Royal blue (NaHep).

Specimens transported in containers other than Royal Blue blue (K2EDTA) or Royal blue (NaHep) tube or Trace Element-Free Transport Tube. Clotted specimens.

Storage/Transport Temperature:
Room temperature. Also acceptable: Refrigerated.

Stability (from collection to initiation):
Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Trace Elements requisition form may be required (ARUP form #32990).

ORDERING

Synonyms:

- Blood concentration, cadmium
- Cd
- CDB
- LAB3710-VML
- LAB3710VML

Ordering Recommendations:
Useful in the assessment of acute toxicity. For chronic exposure and the assessment of cadmium body burden, Cadmium, Urine (0025040) is preferred.

Performed:
Sun-Sat

Methodology:
Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:
Less than or equal to 5.0 µg/L

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of blood cadmium, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Blood cadmium levels can be used to monitor acute toxicity and in combination with cadmium urine and B-2 microglobulin is the preferred method for monitoring occupational exposure. Symptoms associated with cadmium toxicity vary based upon route of exposure and may include tubular proteinuria, fever, headache, dyspnea, chest pain, conjunctivitis, rhinitis, sore throat and cough. Ingestion of cadmium in high concentration may cause vomiting, diarrhea, salivation, cramps, and abdominal pain.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Methodology:

Quantitative Inductively Coupled Plasma-Mass Spectrometry (ICP-MS)

Collect:

Royal blue (K2EDTA) or Royal blue (NaHep).

Specimen Preparation:

Transport 6 mL whole blood in the original collection tube. (Min: 0.5 mL)

Patient Preparation:

Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, non-essential over-the-counter medications (upon the advice of their physician).

Unacceptable Conditions:

Specimens collected in tubes other than Royal blue (K2EDTA) or Royal blue (NaHep).

Specimens transported in containers other than Royal Blue blue (K2EDTA) or Royal blue (NaHep) tube or Trace Element-Free Transport Tube. Clotted specimens.

Stability (from collection to initiation):

Ambient: Indefinitely; Refrigerated: Indefinitely; Frozen: Unacceptable

Storage/Transport Temperature:

Room temperature. Also acceptable: Refrigerated.

Synonyms:

- Blood concentration, cadmium
- Cd
- CDB
- LAB3710-VML
- LAB3710VML

Performed:

Sun-Sat

Resulting Laboratory:

ARUP Laboratories

Reported:

1-3 days

Ordering Recommendations:

Useful in the assessment of acute toxicity. For chronic exposure and the assessment of cadmium body burden, Cadmium, Urine (0025040) is preferred.

Interpretive Data:

Elevated results may be due to skin or collection-related contamination, including the use of a noncertified metal-free collection/transport tube. If contamination concerns exist due to elevated levels of blood cadmium, confirmation with a second specimen collected in a certified metal-free tube is recommended.

Blood cadmium levels can be used to monitor acute toxicity and in combination with cadmium urine and B-2 microglobulin is the preferred method for monitoring occupational exposure. Symptoms associated with cadmium toxicity vary based upon route of exposure and may include tubular proteinuria, fever, headache, dyspnea, chest pain, conjunctivitis, rhinitis, sore throat and cough. Ingestion of cadmium in high concentration may cause vomiting, diarrhea, salivation, cramps, and abdominal pain.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Cadmium, Urine

LAB370

ORDERING INFO

Collect:
24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Synonyms:

- Cd
- CDU
- LAB370-VML
- LAB370VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Diet, medication, and nutritional supplements may introduce interfering substances. Patients should be encouraged to discontinue nutritional supplements, vitamins, minerals, and non-essential over-the-counter medications (upon the advice of their physician). High concentrations of iodine may interfere with elemental testing. Abstinence from iodine-containing medications or contrast agents for at least 1 month prior to collecting specimens for elemental testing is recommended.

Collect:
24-hour or random urine collection. Specimen must be collected in a plastic container. ARUP studies indicate that refrigeration of urine alone, during and after collection, preserves specimens adequately, if tested within 14 days of collection.

Specimen Preparation:
Transfer an 8 mL aliquot from a well-mixed collection to ARUP Trace Element-Free Transport Tubes (ARUP supply #43116). Available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at (800) 522-2787. (Min: 1 mL)

Unacceptable Conditions:
Urine collected within 48 hours after administration of a gadolinium (Gd) containing contrast media (may occur with MRI studies). Acid preserved urine. Specimen contaminated with blood or fecal material. Specimens transported in non-trace element free transport tube (with the exception of the original device).

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature or frozen.

Stability (from collection to initiation):
Ambient: 1 week; Refrigerated: 2 weeks; Frozen: 1 year

Performed:
Sun-Sat

Remarks:
Trace Elements requisition form may be required (ARUP form #32990-Barcode; #32991-No Barcode). Record total volume and collection time interval on transport tube and on test request form.

</table>

Interpretive Data:

Urine cadmium levels can be used to assess cadmium body burden. In chronic exposures, the kidneys are the primary target organ. Symptoms associated with cadmium toxicity vary based upon route of exposure and may include tubular proteinuria, fever, headache, dyspnea, chest pain, conjunctivitis, rhinitis, sore throat and cough. Ingestion of cadmium in high concentration may cause vomiting, diarrhea, salivation, cramps, and abdominal pain.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Calcitonin

LAB6011

ORDERING INFO

Collect:
Serum separator tube or green (sodium or lithium heparin).

Synonyms:

- Human Calcitonin
- Thyrocalcitonin
- LAB6011-VML
- LAB6011VML

SPECIMEN REQUIREMENTS

Collect:
Serum separator tube or green (sodium or lithium heparin).

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 2 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Tissue or urine. EDTA plasma. Grossly hemolyzed or lipemic specimens.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 1 week; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Human Calcitonin
- Thyrocalcitonin
- LAB6011-VML
- LAB6011VML

Ordering Recommendations:
Use to diagnose and monitor medullary thyroid carcinoma (MTC). Secondary test to assist in diagnosing multiple endocrine neoplasia type II and familial MTC.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
1-2 days

RESULTS INTERPRETATION

Reference Interval:
Male 3 years and older: 0.0-7.5 pg/mL
Female 3 years and older: 0.0-5.1 pg/mL

Interpretive Data:
Calcitonin levels greater than 100 pg/mL may occur in the following conditions: medullary thyroid carcinomas (MTC), leukemias, and myeloproliferative disorders.

Provocative testing (calcium) is suggested in patients with MTC if the calcitonin is not clearly diagnostic.

The Siemens Immulite® 2000 method is used. Results obtained with different assay methods or kits cannot be used interchangeably. Calcitonin is useful in monitoring medullary thyroid carcinoma. The calcitonin assay value, regardless of level, should not be interpreted as absolute evidence of the presence or absence of malignant disease.

Methodology:
Quantitative Chemiluminescent Immunoassay

Calprotectin, Fecal

LAB6504

ORDERING INFO

Collect:

Stool in clean container

Synonyms:

- Calprotectin, Stool
- Fecal Calprotectin
- LAB6504-VML
- LAB6504VML

Turn Around Time:

1 - 3 Days

SPECIMEN REQUIREMENTS

Patient Preparation:

NA

Collect:

Stool in clean container

Specimen Preparation:

Collect stool sample in clean container, store refrigerated.

Pediatric Collection:

Stool in clean container

Storage/Transport Temperature:

Refrigerated (2-8°C)

Performed:

Monday - Friday

Stability:

Refrigerated (2-8°C): 72 hours

Specimen:

Stool

Alternate Specimen:

NA

ORDERING

Ordering Indicators:

This test aids in differentiation of inflammatory bowel disease (IBD) from irritable bowel syndrome (IBS)

Synonyms:

- Calprotectin, Stool
- Fecal Calprotectin
- LAB6504-VML
- LAB6504VML

Performed:
Monday - Friday

Turn Around Time:
1 - 3 Days

Methodology:
Chemiluminescent Immunoassay

Components:
Calprotectin, Fecal

RESULTS INTERPRETATION

Reference Interval:
<50 ug/g

Interpretive Data:
Calprotectin concentrations above 120 ug/g are suggestive of an active inflammatory process within the gastrointestinal system. Fecal Calprotectin is not specific for IBD, the diagnosis of IBD cannot be established solely on the basis of a positive calprotectin result.

Methodology:
Chemiluminescent Immunoassay

Calreticulin (CALR) Exon 9 Mutation Analysis by PCR, whole blood or bone marrow

LAB3028

ORDERING INFO

Collect:
Lavendar tube (EDTA)

Synonyms:

- LAB3028, CAL, CALR, CALR Insert/Deletion Mutation
- LAB3028-VML
- LAB3028VML

Turn Around Time:
10 days

SPECIMEN REQUIREMENTS

Patient Preparation:
Call the Molecular Diagnostics Laboratory at 615-343-8121 if additional assistance is needed regarding specimen requirements or submission or if patient has received a transfusion in the prior 2 weeks.

Collect:
Lavendar tube (EDTA)

Specimen Preparation:
Specimen should be designated for MDL only, not shared with other labs or add-on testing. (Min 0.5mL whole blood or bone marrow)

Pediatric Collection:
Two Lavender microtainers (EDTA)

Storage/Transport Temperature:
Blood or bone marrow: Ambient (15-25°C) or Refrigerated (2-8°C); Purified DNA: Refrigerated (2-8°C) or Frozen (-20°C).

Performed:
Once per week - variable days

Stability:
EDTA and ACD-A tubes: Ambient (15-25°C): 2 days; Refrigerated (2-8°C)C: 7 days; Purified DNA: indefinitely at -70°C.

Specimen:
Whole blood or bone marrow

Alternate Specimen:
Yellow tube (ACD-A)

ORDERING

Ordering Indicators:
Identification of CALR variants provides diagnostic and prognostic information in JAK2/MPL-negative patients with myeloproliferative neoplasms (MPNs).

Synonyms:

- LAB3028, CAL, CALR, CALR Insert/Deletion Mutation
- LAB3028-VML
- LAB3028VML

Performed:
Once per week - variable days

Turn Around Time:
10 days

Methodology:
Fluorescent PCR designed to detect CALR exon 9 insertions or deletions with fragment size analysis by capillary electrophoresis; Laboratory Developed Test

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
Disease-associated variants in CALR typically involve exon 9 and most frequently involve a frameshift alteration. The following alterations are the most common ones observed; a 52 bp deletion or a 5 bp insertion. Results must be interpreted in the appropriate clinical context. Refer to report.

Methodology:
Fluorescent PCR designed to detect CALR exon 9 insertions or deletions with fragment size analysis by capillary electrophoresis; Laboratory Developed Test

Cancer Antigen 27.29

LAB853

ORDERING INFO

Collect:
Plain red or serum separator tube or EDTA plasma.

Synonyms:

- Breast Carcinoma-Associated Antigen (CA 27.29), Serum
- CA 27.29
- MAM 6
- Milk Mucin
- Breast Cancer Tumor Markers
- CA 27-29
- LAB853-VML
- LAB853VML

SPECIMEN REQUIREMENTS

Collect:
Plain red or serum separator tube or EDTA plasma.

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate serum from cells ASAP or within 2 hours of collection. Transfer 1 mL serum to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Storage/Transport Temperature:
Frozen.

Stability (from collection to initiation):
After separation from cells: Ambient: 8 hours; Refrigerated: 7 days; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Breast Carcinoma-Associated Antigen (CA 27.29), Serum
- CA 27.29
- MAM 6
- Milk Mucin
- Breast Cancer Tumor Markers
- CA 27-29
- LAB853-VML
- LAB853VML

Ordering Recommendations:
Monitor therapy and identify disease recurrence in individuals with a metastatic breast cancer diagnosis. Do not use for diagnosis or screening of breast cancer.

Performed:
Sun-Sat

Methodology:
Quantitative Chemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
Effective August 16, 2021
Less than or equal to 39 U/mL

Interpretive Data:

Test Information: The CA 27.29 assay is intended for use in monitoring: 1) disease progression and/or response to therapy in patients with metastatic disease, and 2) disease recurrence in patients treated previously for stages II or III breast carcinoma who are clinically free of the disease. Serial testing in patients who are clinically free of disease should be used in conjunction with other clinical methods for early detection of cancer recurrence.

Limitations: Patients with confirmed breast carcinoma frequently have CA 27.29 assay values in the same range as healthy individuals. Elevations may also be observed in patients with non-malignant disease. Results of this test must always be interpreted in the context of morphologic and other relevant data and should not be used alone for a diagnosis of malignancy.

Methodology: Siemens Atellica IM BR 27.29 (BR) chemiluminescent immunoassay was used. Results obtained with different assay methods or kits cannot be used interchangeably.

Methodology:

Quantitative Chemiluminescent Immunoassay

Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
0-31 U/mL

Interpretive Data:
The Roche CA 15-3 electrochemiluminescent immunoassay is used. Results obtained with different methods or kits cannot be used interchangeably. The CA 15-3 test is used to aid in the management of Stage II and III breast cancer patients. Serial testing for patient CA 15-3 values should be used in conjunction with other clinical methods for monitoring breast cancer. Patients with confirmed breast carcinoma frequently have CA 15-3 values in the same range as healthy individuals. Elevations may be observed in patients with nonmalignant disease. Therefore, a CA 15-3 value, regardless of level, should not be interpreted as absolute evidence of the presence or absence of malignant disease.

Within 24 hours

Ordering Recommendations:
Monitor therapy and identify disease recurrence in individuals with metastatic breast cancer. Do not use for diagnosis or screening of breast cancer.

Interpretive Data:
The Roche CA 15-3 electrochemiluminescent immunoassay is used. Results obtained with different methods or kits cannot be used interchangeably. The CA 15-3 test is used to aid in the management of Stage II and III breast cancer patients. Serial testing for patient CA 15-3 values should be used in conjunction with other clinical methods for monitoring breast cancer. Patients with confirmed breast carcinoma frequently have CA 15-3 values in the same range as healthy individuals. Elevations may be observed in patients with nonmalignant disease. Therefore, a CA 15-3 value, regardless of level, should not be interpreted as absolute evidence of the presence or absence of malignant disease.

Reference Interval:
0-31 U/mL

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Cancer Antigen-GI (CA 19-9)

LAB777

ORDERING INFO

Collect:
Serum Separator Tube (SST) or Plasma Separator Tube (PST). Also acceptable: Green (lithium heparin), Lavender (K_2EDTA or K_3EDTA), or Pink (K_2EDTA).

Synonyms:

- CA 19-9
- Cancer Antigen 19-9
- CA-GI
- Cancer Antigen-GI
- Carbohydrate Antigen
- Carbohydrate Antigen 19-9
- GI Cancer Antigen
- LAB777-VML
- LAB777VML

SPECIMEN REQUIREMENTS

Collect:
Serum Separator Tube (SST) or Plasma Separator Tube (PST). Also acceptable: Green (lithium heparin), Lavender (K_2EDTA or K_3EDTA), or Pink (K_2EDTA).

Specimen Preparation:
Allow specimen to clot completely at room temperature. Separate from cells ASAP or within 2 hours of collection. Transfer 1 mL serum or plasma to an ARUP Standard Transport Tube. (Min: 0.5 mL)

Unacceptable Conditions:
Body Fluid (refer to Cancer Antigen-GI (CA19-9), Body Fluid, ARUP test code 0020746). Specimens collected in sodium citrate.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
After separation from cells: Ambient: 5 days; Refrigerated: 2 weeks; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- CA 19-9
- Cancer Antigen 19-9
- CA-GI
- Cancer Antigen-GI
- Carbohydrate Antigen

- GI Cancer Antigen
- LAB777-VML
- LAB777VML

Performed:
Sun-Sat

Methodology:
Quantitative Electrochemiluminescent Immunoassay

Reported:
Within 24 hours

RESULTS INTERPRETATION

Reference Interval:
Effective February 22, 2022
Less than or equal to 35 U/mL

Interpretive Data:
This test uses Roche CA 19-9 electrochemiluminescent immunoassay. Results obtained with different test methods or kits cannot be used interchangeably. CA 19-9 is useful in monitoring pancreatic, hepatobiliary, gastric, hepatocellular, and colorectal cancer. CA 19-9 value regardless of level, should not be interpreted as absolute evidence of the presence or absence of malignant disease.

Methodology:
Quantitative Electrochemiluminescent Immunoassay

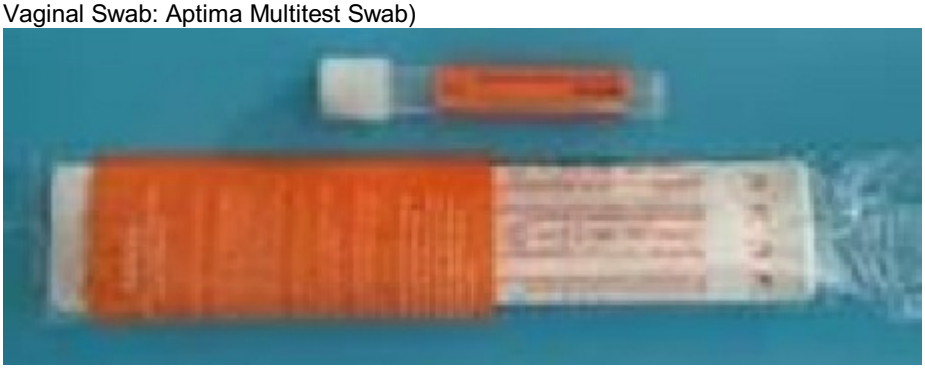
Candida Vaginosis and Trichomonas vaginalis by Transcription-Mediated Amplification (TMA)

LAB6083

ORDERING INFO

Collect:

Vaginal Swab: Aptima Multitest Swab)



Synonyms:

- LAB6083, CV, TV, Trich, Wet Prep, PCR, Candida PCR, Yeast Panel, Trichomonas vaginalis
- LAB6083-VML
- LAB6083VML

Turn Around Time:

72 hours

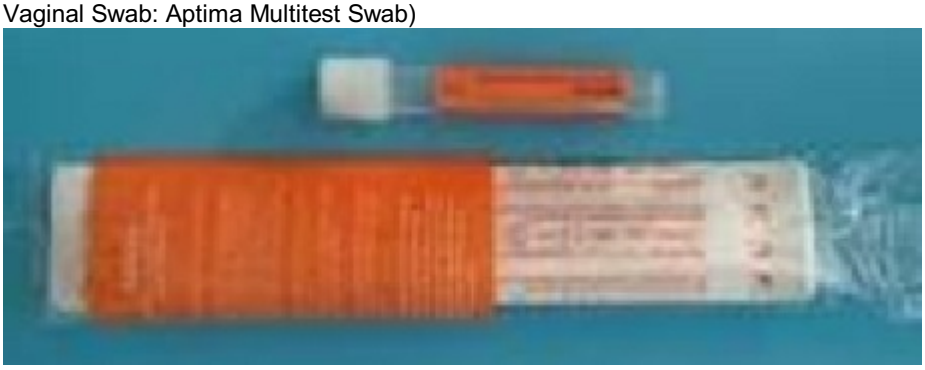
SPECIMEN REQUIREMENTS

Patient Preparation:

N/A

Collect:

Vaginal Swab: Aptima Multitest Swab)



Specimen Preparation:

Place swab in MultiTest Swab Specimen Transport Tube (orange), break shaft at scoreline then recap tube. (Min 1.0mL Swab)

Pediatric Collection:

Performance of the assay has not been evaluated in women less than 14 years of age.

Storage/Transport Temperature:

Ambient (15-25°C)

Performed:

Monday - Friday

Stability:

Ambient (15-25°C): 30 days

Specimen:

Vaginal

Alternate Specimen:

Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

ORDERING

Ordering Indicators:
Results from the Aptima CV/TV assay should be interpreted in conjunction with other clinical data available to the clinician. A negative result does not preclude a possible infection because results are dependent on adequate specimen collection. A Candida species group positive result can be due to one or multiple Candida species (C. albicans, C. tropicalis, C. parapsilosis, C. dubliniensis)

Synonyms:

- LAB6083, CV, TV, Trich, Wet Prep, PCR, Candida PCR, Yeast Panel, Trichomonas vaginalis
- LAB6083-VML
- LAB6083VML

Performed:
Monday - Friday

Turn Around Time:
72 hours

Methodology:
Transcription-Mediated Amplificiation (TMA)

Components:
N/A

RESULTS INTERPRETATION

Reference Interval:
Not detected

Interpretive Data:
A negative result does not preclude a possible infection. This test detects Trichomonas vaginalis, Candida glabrata, and other Candida species (C. albicans, C. parapsilosis, C. dubliniensis, and C. tropicalis). The assay does not differentiate among organisms in the Candida species group. Results should be interpreted in conjunction with other clinical data. This test has not been validated for use with specimens collected by patients at home. This test is intended for medical purposes only and is not valid for the evaluation of suspected sexual abuse or for other forensic purposes.

Methodology:
Transcription-Mediated Amplificiation (TMA)

ADDITIONAL INFORMATION

Section:
Molecular Infectious Disease

Alternate Specimen:
Other specimens/sources need Medical Director approval. Please call 615-875-5227 to speak with the lab.

Additional Information:
The Aptima CV/TV assay has not been evaluated for use with specimens collected by patients at home. Therapeutic failure or success cannot be determined with the Aptima CV/TV assay since nucleic acid may persist following appropriate antimicrobial therapy.

Components:
N/A

Resulting Laboratory:
Vanderbilt Medical Laboratories

Carbamazepine, Free and Total, Serum or Plasma

LAB3711

ORDERING INFO

Collect:
Serum Pre-dose (Trough) Draw - At a Steady State Concentration in Plain Red.

Synonyms:

- Protein Free Carbamazepine
- Sirtal
- Atretol
- Biston
- Calesin
- Carbamazepine, Free
- Epitol
- Equetro
- Free Carbamazepine
- Epimaz
- Epitrol
- Finlepsin
- Free Tegretol
- Carbatrol
- Tegretol, Free
- Telesmin
- LAB3711-VML
- LAB3711VML

SPECIMEN REQUIREMENTS

Collect:
Serum Pre-dose (Trough) Draw - At a Steady State Concentration in Plain Red.

Specimen Preparation:
Separate from cells ASAP or within 2 hours of collection. Transfer 2 mL serum to an ARUP Standard Transport Tube. (Min: 1 mL)

Unacceptable Conditions:
Whole Blood, Citrated Plasma. Tubes that contain liquid anticoagulant.or Serum separator tube (SST).

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Ambient: 5 days; Refrigerated: 5 days; Frozen: 3 months

Performed:
Sun-Sat

ORDERING

Synonyms:

- Protein Free Carbamazepine
- Sirtal
- Atretol
- Biston
- Calesin
- Carbamazepine, Free
- Epitol
- Equetro
- Free Carbamazepine
- Epimaz
- Epitrol
- Finlepsin
- Free Tegretol
- Carbatrol
- Tegretol, Free
- Telesmin
- LAB3711-VML
- LAB3711VML

Ordering Recommendations:
Optimize drug therapy and monitor patient adherence.

Performed:
Sun-Sat

Methodology:
Quantitative Enzyme Multiplied Immunoassay Technique

Reported:
1-5 days

RESULTS INTERPRETATION

Reference Interval:
Effective November 16, 2015

Components	Reference Interval
Total Carbamazepine	Therapeutic Range: 4.0-12.0 µg/mL Toxic Range: Greater than 15 µg/mL
Free Carbamazepine	Therapeutic Range: 1.0-3.0 µg/mL Toxic Range: Greater than 3.8 µg/mL
Percent Free Carbamazepine	8.0-35.0%

Interpretive Data:
The therapeutic range is based on serum pre-dose (trough) draw at steady-state concentration. Free carbamazepine may be important to monitor in patients with altered or unpredictable protein binding capacity. Carbamazepine is also subject to drug-drug interactions due to displacement of protein binding and extensive metabolism. Cross-reactivity with metabolites may account for differences in carbamazepine among analytical methods. Calculating percent free attempts to minimize differences in assay cross-reactivity and may be useful in dose optimization.

A rare adverse drug reaction to carbamazepine therapy includes Stevens-Johnson syndrome or toxic epidermal necrolysis. Patients of Asian ancestry with the presence of the HLA-B*15:02 have an increased risk for this carbamazepine-induced life-threatening reaction. Pharmacogenetic testing for HLA-B*15:02 is recommended for patients at risk for carbamazepine hypersensitivity prior to treatment. This information has been included in the FDA-approved label for carbamazepine (https://www.accessdata.fda.gov/scripts/cder/daf/index.cfm) and guideline from the Clinical Pharmacogenetics Implementation Consortium (https://www.pharmgkb.org/guidelines) [ARUP test code 2012049, HLA-B*15:02 Genotyping, Carbamazepine Hypersensitivity.] A combination of therapeutic drug monitoring with HLA-B*15:02 pharmacogenetics genotyping may benefit patients who are at increased risk for developing carbamazepine-induced adverse events due to rare genotypes other than HLA-B*15:02 variant allele.

Cardiolipin Antibodies, IgG and IgM

LAB1735

ORDERING INFO

Collect:

Light blue tube (3.2% Sodium Citrate)

Synonyms:

- LAB1735, Antiphospholipid antibody, Anticardiolipin Antibody, APA, ACL AB
- LAB1735-VML
- LAB1735VML

Turn Around Time:

2 - 6 days

SPECIMEN REQUIREMENTS

Patient Preparation:

Indwelling lines should be flushed with saline only and 5 mL of blood should be discarded prior to collecting coagulation samples. When using a winged collection device (butterfly), draw a discard tube prior to the patient sample. Collecting a waste tube prevents underfilling the tube and ensures the proper blood to anticoagulant ratio.

Collect:

Light blue tube (3.2% Sodium Citrate)

Specimen Preparation:

Collect adequate 2.7 mL or 1.8 mL light blue top tubes for the requested tests. Tubes must be filled to the indicator line and not clotted. Do not place on ice. Whole blood must be recieved within 8 hours of collection. If sending plasma aliquots, double centrifugation is required. Transfer the plasma to a polypropylene tube and repeat the centrifugation step to produce platelet poor plasma. Transfer the plasma to a polypropylene tube and freeze immediately. The aliquot must remain frozen until received in the laboratory. (Minimum 1.0 mL platelet poor plasma.)

Pediatric Collection:

Pediatric: One 2.7 mL light blue tube (3.2% Sodium Citrate). Neonatal: One 1.8mL light blue tube (3.2% Sodium Citrate).

Storage/Transport Temperature:

Ambient: (15-25°C) for Light blue tube, must be received within 8 hours of draw. Plasma aliquot(s) must be frozen if not received by lab within 8 hours of collection.

Performed:

Twice weekly, variable days.

Stability:

Refrigerated (2-8°C): 8 Hours, frozen at -70C: 1 month

Specimen:

Citrated platelet poor plasma .

Alternate Specimen:

N/A

ORDERING

Ordering Indicators:

Anticardiolipin antibodies should be ordered as a part of an assessment for antiphospholipid antibody syndrome.

Synonyms:

- LAB1735, Antiphospholipid antibody, Anticardiolipin Antibody, APA, ACL AB
- LAB1735-VML
- LAB1735VML

Performed:
Twice weekly, variable days.

Turn Around Time:
2 - 6 days

Methodology:
ELISA (Enzyme-linked Immunosorbent Assay)

Components:
Antiphospholipid Antibodies IgG and IgM

RESULTS INTERPRETATION

Reference Interval:
IgG: < 23 GPL, IgM: < 11 MPL

Interpretive Data:
The persistent presence of IgG and/or IgM cardiolipin (CL) antibodies in moderate or high levels (greater than 40 GPL and/or greater than 40 MPL units) is a laboratory criterion for the diagnosis of antiphospholipid syndrome (APS). Persistence is defined as moderate or high levels of IgG and/or IgM CL antibodies detected in two or more specimens drawn at least 12 weeks apart (J Throm Haemost. 2006;4:295-306). Lower positive levels of IgG and/or IgM CL antibodies (above cutoff but less than 40 GPL and/or less than 40 MPL units) may occur in patients with the clinical symptoms of APS; therefore, the actual significance of these levels is undefined. Results should not be used alone for diagnosis and must be interpreted in light of APS-specific clinical manifestations and/or other criteria phospholipid antibody tests.

Methodology:
ELISA (Enzyme-linked Immunosorbent Assay)

ADDITIONAL INFORMATION

Cardiomyopathy NGS Panel, Blood Saliva DNA

LAB6275

ORDERING INFO

Collect:

Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Synonyms:

- LAB6275, Cardiomyopathy NGS Panel, Next Generation Sequencing
- LAB6275-VML
- LAB6275VML

Turn Around Time:

30 Business Days From Financial Clearance

SPECIMEN REQUIREMENTS

Patient Preparation:

Saliva: Patient Must Follow Kit Instructions

Collect:

Blood: Lavender Tube (EDTA); Saliva: Special Collection Kit (Provided by Lab)

Specimen Preparation:

Extracted DNA should be sent in a screw cap tube with at least 2 micrograms - 5 micrograms of purified DNA at a concentration of at least 20 ng/ul - 50 ng/uL. Indicate patient's name, date of birth, and concentration on tube label. (Minimum Volume: 2 micrograms for limited specimens)

Pediatric Collection:

REVIEW

Carnitine, Free & Total (Includes Carnitine, Esterified)

LAB815

ORDERING INFO

Collect:
Green (sodium or lithium heparin). Also acceptable: Plain red.

Synonyms:

- Free and Total Carnitine
- L-Carnitine Free and Total
- Esterified carnitine
- LAB815-VML
- LAB815VML

SPECIMEN REQUIREMENTS

Collect:
Green (sodium or lithium heparin). Also acceptable: Plain red.

Specimen Preparation:
Separate serum or plasma from cells ASAP or within 2 hours of collection. Transfer 0.5 mL serum or plasma to an ARUP standard transport tube and freeze immediately. (Min: 0.2 mL) Avoid hemolysis.

Unacceptable Conditions:
Room temperature specimens. Specimens refrigerated greater than 12 hours.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: 12 hours; Frozen: 1 month (avoid repeated freeze/thaw cycles)

Performed:
Tue-Sat

ORDERING

Synonyms:

- Free and Total Carnitine
- L-Carnitine Free and Total
- Esterified carnitine
- LAB815-VML
- LAB815VML

Ordering Recommendations:
Useful in the diagnosis of primary carnitine deficiency (carnitine uptake defect). Monitor carnitine status.

Performed:
Tue-Sat

Methodology:
Tandem Mass Spectrometry

Reported:
1-4 days

Notes:
The concentration of esterified carnitine is derived from a mathematical calculation using free and total carnitine.

RESULTS INTERPRETATION

Reference Interval:

Age	Carnitine, Free, Serum/Plasma	Carnitine, Total, Serum/Plasma	Carnitine, Esterified, Serum/Plasma	Carnitine E/F Ratio, Serum/Plasma

Catecholamines Fractionated by LC-MS/MS, Urine Free

LAB6088

ORDERING INFO

Collect:
24-hour or random urine. Refrigerate 24-hour specimen during collection.

Synonyms:

- Adrenaline
- Dopamine, Random
- Epinephrine, Random
- Fractionation, Catecholamines
- Free Catecholamine Fractionation
- Noradrenaline
- Norepinephrine, Random
- LAB6088-VML
- LAB6088VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Drugs and medications may affect results and should be discontinued for at least 72 hours prior to specimen collection, if possible.

Collect:
24-hour or random urine. Refrigerate 24-hour specimen during collection.

Specimen Preparation:
Thoroughly mix entire collection (24-hour or random) in one container. Transfer a 4 mL aliquot to an ARUP standard transport tube. (Min: 2.5 mL) Catecholamines are not stable above pH 7. The pH of such specimens must be adjusted by the addition of 6M HCl acid or sulfamic acid prior to transport. A pH less than 2 can cause assay interference.
Specimen preservation can be extended to 1 month refrigerated by performing one of the following:
Option 1: Transfer a 4 mL aliquot to an ARUP standard transport tube and adjust pH to 2.0-4.0 with 6M HCl. (Min: 2.5 mL)
Option 2: Transfer a 4 mL aliquot to an ARUP standard transport tube containing 20 mg sulfamic acid (ARUP Supply #48098), available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787. (Min: 2.5 mL)

Unacceptable Conditions:
Specimens preserved with boric acid or acetic acid. Specimens with pH greater than 7.

Storage/Transport Temperature:
Refrigerated.

Stability (from collection to initiation):
Unpreserved: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: Undefined
Preserved: Ambient: Unacceptable; Refrigerated: 1 month; Frozen: 6 months

Performed:
Sun-Sat

Remarks:
Record total volume and collection time interval on transport tube and test request form.

ORDERING

Synonyms:

- Adrenaline
- Dopamine, Random
- Epinephrine, Random
- Fractionation, Catecholamines
- Free Catecholamine Fractionation
- Noradrenaline
- Norepinephrine, Random
- LAB6088-VML
- LAB6088VML

Ordering Recommendations:
Not recommended for the evaluation of pheochromocytoma or paraganglioma. Use to evaluate clinical symptoms of excess catecholamine secretion. For the assessment of pheochromocytoma or paraganglioma, refer to Metanephrines, Plasma (Free) (0050184) or Metanephrines Fractionated by HPLC-MS/MS, Urine (2007996).

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-5 days

Notes:
Secreting neuroendocrine tumors are typically associated with catecholamine concentrations several times higher than the upper reference intervals. Large elevations can be seen in life-threatening illnesses and drug interferences. Common reasons for slight and moderate elevations include intense physical activity, emotional and physical stress, drug interferences, and improper specimen collection.

Medications which may physiologically interfere with catecholamines and metabolites include amphetamines and amphetamine-like compounds, appetite suppressants, bromocriptine, buspirone, caffeine, carbidopa-levodopa (Sinemet), clonidine, dexamethasone, diuretics (in doses sufficient to deplete sodium), ethanol, isoproterenol, methyldopa (Aldomet), MAO inhibitors, nicotine, nose drops, propafenone (Rythmol), reserpine, theophylline, tricyclic antidepressants, and vasodilators. The effects of some drugs on catecholamine results may not be predictable.

References: 1) Optimal collection and storage conditions for catecholamine measurements in human plasma and urine. (Clinical Chemistry. 1993;39:2503-8.); 2) Effect of urine pH, storage time, and temperature on stability of catecholamines, cortisol, and creatinine. (Clinical Chemistry1998;44:1759-62.).

RESULTS INTERPRETATION

Reference Interval:

Components

Creatinine, Urine - per 24h

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300
13-17 years	500-2300	400-1600
18-50 years	1000-2500	700-1600
51-80 years	800-2100	500-1400
81 years and older	600-2000	400-1300

Dopamine, Urine - per 24h

Age	ug/d
0-3 years	Not established
4-10 years	80-440
11-17 years	100-496
18 years and older	71-485

Norepinephrine, Urine - per 24h

Age	ug/d
0-3 years	Not established
4-10 years	7-65
11-17 years	12-96
18 years and older	14-120

Epinephrine, Urine - per 24h

Age	ug/d
0-3 years	Not established
4-10 years	1-14
11-17 years	1-18
18 years and okder	1-14

Norepinephrine, Urine - ratio to CRT

Age	ug/g CRT
0-11 months	25-310
1-3 years	25-290
4-10 years	27-110
11-17 years	4-105
18 years and older	0-45

Dopamine, Urine - ratio to CRT

Age	ug/g CRT
0-11 months	240-1290
1-3 years	80-1220
4-10 years	220-720
11-17 years	120-450
18 years and older	0-250

Epinephrine, Urine - ratio to CRT

Age	ug/g CRT
0-11 months	0-380
1-3 years	0-82
4-10 years	5-93
11-17 years	3-58
18 years and older	0-20

Interpretive Data:

Smaller increases in catecholamine concentrations (less than two times the upper limit) usually are the result of physiological stimuli, drugs, or improper specimen collection. Significant elevation of one or more catecholamines (three or more times the upper reference limit) is associated with an increased probability of a neuroendocrine tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

Methodology:

Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Large elevations can be seen in life-threatening illnesses and drug interferences. Common reasons for slight and moderate elevations include intense physical activity, emotional and physical stress, drug interferences, and improper specimen collection.

Medications which may physiologically interfere with catecholamines and metabolites include amphetamines and amphetamine-like compounds, appetite suppressants, bromocriptine, buspirone, caffeine, carbidopa-levodopa (Sinemet), clonidine, dexamethasone, diuretics (in doses sufficient to deplete sodium), ethanol, isoproterenol, methyldopa (Aldomet), MAO inhibitors, nicotine, nose drops, propafenone (Rythmol), reserpine, theophylline, tricyclic antidepressants, and vasodilators. The effects of some drugs on catecholamine results may not be predictable.

References: 1) Optimal collection and storage conditions for catecholamine measurements in human plasma and urine. (Clinical Chemistry. 1993;39:2503-8.); 2) Effect of urine pH, storage time, and temperature on stability of catecholamines, cortisol, and creatinine. (Clinical Chemistry1998;44:1759-62.).

Resulting Laboratory:

ARUP Laboratories

FULL VIEW

Collect:

24-hour or random urine. Refrigerate 24-hour specimen during collection.

Specimen Preparation:

Thoroughly mix entire collection (24-hour or random) in one container. Transfer a 4 mL aliquot to an ARUP standard transport tube. (Min: 2.5 mL) Catecholamines are not stable above pH 7. The pH of such specimens must be adjusted by the addition of 6M HCl acid or sulfamic acid prior to transport. A pH less than 2 can cause assay interference.
Specimen preservation can be extended to 1 month refrigerated by performing one of the following:
Option 1: Transfer a 4 mL aliquot to an ARUP standard transport tube and adjust pH to 2.0-4.0 with 6M HCl. (Min: 2.5 mL)
Option 2: Transfer a 4 mL aliquot to an ARUP standard transport tube containing 20 mg sulfamic acid (ARUP Supply #48098), available online through eSupply using ARUP Connect(TM) or contact ARUP Client Services at 800-522-2787. (Min: 2.5 mL)

Patient Preparation:

Drugs and medications may affect results and should be discontinued for at least 72 hours prior to specimen collection, if possible.

Unacceptable Conditions:

Specimens preserved with boric acid or acetic acid. Specimens with pH greater than 7.

Stability (from collection to initiation):

Unpreserved: Ambient: Unacceptable; Refrigerated: 1 week; Frozen: Undefined
Preserved: Ambient: Unacceptable; Refrigerated: 1 month; Frozen: 6 months

Storage/Transport Temperature:

Refrigerated.

ARUP Laboratories

Reported:
1-5 days

Ordering Recommendations:
Not recommended for the evaluation of pheochromocytoma or paraganglioma. Use to evaluate clinical symptoms of excess catecholamine secretion. For the assessment of pheochromocytoma or paraganglioma, refer to Metanephrines, Plasma (Free) (0050184) or Metanephrines Fractionated by HPLC-MS/MS, Urine (2007996).

Interpretive Data:
Smaller increases in catecholamine concentrations (less than two times the upper limit) usually are the result of physiological stimuli, drugs, or improper specimen collection. Significant elevation of one or more catecholamines (three or more times the upper reference limit) is associated with an increased probability of a neuroendocrine tumor.

Per 24h calculations are provided to aid interpretation for collections with a duration of 24 hours and an average daily urine volume. For specimens with notable deviations in collection time or volume, ratios of analytes to a corresponding urine creatinine concentration may assist in result interpretation.

Reference Interval:

Components

Creatinine, Urine - per 24h

Age	Male (mg/d)	Female (mg/d)
3-8 years	140-700	140-700
9-12 years	300-1300	300-1300

Section:
RF-ARUP

CPT Codes:
82384

Remarks:
Record total volume and collection time interval on transport tube and test request form.

Notes:
Secreting neuroendocrine tumors are typically associated with catecholamine concentrations several times higher than the upper reference intervals. Large elevations can be seen in life-threatening illnesses and drug interferences. Common reasons for slight and moderate elevations include intense physical activity, emotional and physical stress, drug interferences, and improper specimen collection.

Medications which may physiologically interfere with catecholamines and metabolites include amphetamines and amphetamine-like compounds, appetite suppressants, bromocriptine, buspirone, caffeine, carbidopa-levodopa (Sinemet), clonidine, dexamethasone, diuretics (in doses sufficient to deplete sodium), ethanol, isoproterenol, methyldopa (Aldomet), MAO inhibitors, nicotine, nose drops, propafenone (Rythmol), reserpine, theophylline, tricyclic antidepressants, and vasodilators. The effects of some drugs on catecholamine results may not be predictable.

- LAB963-VML
- LAB963VML

SPECIMEN REQUIREMENTS

Patient Preparation:
Patient should be calm and seated for 15 minutes prior to collection. Alternately, patient may be calm and supine for 30 minutes prior to collection. Drugs and medications may affect results and should be discontinued for 72 hours prior to specimen collection, if possible.

Collect:
Green (sodium or lithium heparin), lavender (EDTA). Collect on ice.

Specimen Preparation:
Specimen should be centrifuged and frozen within one hour (refrigerated centrifuge is preferred but not required). Transfer 3 mL plasma to an ARUP standard transport tube(Min: 1.1 mL)

Unacceptable Conditions:
Serum or urine.

Storage/Transport Temperature:
CRITICAL FROZEN. Separate specimens must be submitted when multiple tests are ordered.

Stability (from collection to initiation):
After separation from cells: Ambient: Unacceptable; Refrigerated: Unacceptable; Frozen at -20 C: 1 month; Frozen at -70 C: 1 year

Performed:
Sun-Sat

For the assessment of pheochromocytoma and paraganglioma, refer to Metanephrines, Plasma (Free) (0050184) or Metanephrines Fractionated by HPLC-MS/MS, Urine (2007996).

Performed:
Sun-Sat

Methodology:
Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Reported:
1-4 days

Notes:

Medications may interfere with catecholamines and metabolites. The effect of drugs on catecholamine results may not be predictable. (N Rifai, A R Horvath, and C Wittwer. Tietz Textbook of Clinical Chemistry and Molecular Diagnostics. Sixth edition. St. Louis, Missouri: Elsevier, 2018; Table 63.9.)

For optimum assessment, patient should be supine for 30 minutes prior to specimen collection.

Children, particularly those under 2 years of age, often show an elevated catecholamine response to stress.

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval	
Dopamine	**18 years and older**	
	Seated (15 min)	Less than or equal to 240 pmol/L
Epinephrine	**18 years and older**	
	Seated (15 min)	Less than or equal to 330 pmol/L
Norepinephrine	**18 years and older**	
	Seated (15 min)	1050-4800 pmol/L

Interpretive Data:

Small increases in catecholamines (less than 2 times the upper reference limit) are usually the result of physiological stimuli, drugs, or improper specimen collection. Significant elevation of one or more catecholamines (2 or more times the upper reference limit) can result from a neuroendocrine tumor. Measurement of plasma or urine fractionated metanephrines should be used for assessment of suspected pheochromocytoma or paraganglioma.

Lower catecholamine concentrations are observed in specimens collected from supine adults.

To convert to picograms per milliliter (pg/mL), multiply the reported concentration for dopamine by 0.153, epinephrine by 0.183, and norepinephrine by 0.169

Access complete set of age- and/or gender-specific reference intervals for this test in the ARUP Laboratory Test Directory (aruplab.com).

Supine Reference Intervals	
Dopamine	Less than or equal to 240 pmol/L
Epinephrine	Less than or equal to 265 pmol/L
Norepinephrine	680-3100 pmol/L

Methodology:

Quantitative High Performance Liquid Chromatography-Tandem Mass Spectrometry

Components:
Stained slide and control

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Synonyms:

LAB3712

ORDERING INFO

Collect:
Lavender (EDTA) or Green (Sodium or Lithium Heparin).
New York State Clients: Lavender (EDTA).

Synonyms:

- LAB3712-VML
- LAB3712VML

SPECIMEN REQUIREMENTS

Collect:
Lavender (EDTA) or Green (Sodium or Lithium Heparin).
New York State Clients: Lavender (EDTA).

Specimen Preparation:
Transport 4 mL whole blood. (Min: 0.5 mL)
New York State Clients: Transport 3 mL whole blood in the original collection tube. (Min: 1.5 mL) Do not send to ARUP Laboratories. Specimen must be received at performing laboratory within 48 hours of collection. For specimen requirements and direct submission instructions please contact ARUP Referral Testing at (800) 242-2787, ext. 5145.

Unacceptable Conditions:
Cord blood. Specimens older than 72 hours. Clotted or hemolyzed specimens.

Storage/Transport Temperature:
Refrigerated. Also acceptable: Room temperature.
New York State Clients: Room temperature.

Stability (from collection to initiation):
Ambient: 72 hours; Refrigerated: 72 hours; Frozen: Unacceptable
New York State Clients: Ambient: 48 hours; Refrigerated: Unacceptable; Frozen: Unacceptable

Performed:
Sun-Sat

Remarks:
Specimens must be analyzed within 72 hours of collection.
New York State Clients: Specimens must be analyzed within 48 hours of collection.

ORDERING

Synonyms:

- LAB3712-VML
- LAB3712VML

Ordering Recommendations:
Assess thymic function in suspected severe combined immunodeficiency (SCID), DiGeorge syndrome and other T- cell immune deficiency disorders. Evaluate immune reconstitution during highly active antiviral therapy (HAART) in HIV patients and post chemotherapy and hematopoietic cell transplant.

Performed:
Sun-Sat

Methodology:
Quantitative Flow Cytometry

Reported:
1-3 days

RESULTS INTERPRETATION

Reference Interval:

Components	Reference Interval

% CD4+CD31+CD45RA+ (RTEs)

Age	Reference Interval
1 Week-2 months	50-100% of CD4+
2-5 months	64-94% of CD4+
5-9 months	65-90 % of CD4+
9-15 months	61-93% of CD4+
15-24 months	40-100% of CD4+
2-5 years	37-100% of CD4+
5-10 years	41-81% of CD4+
10-16 years	31-81% of CD4+
>16 years	6-51% of CD4+

Abs CD4+CD31+CD45RA+ (RTEs)

Age	Reference Interval
1 Week-2 months	1000-4900 cells/µL
2-5 months	1400-5200 cells/µL
5-9 months	800-6200 cells/µL
9-15 months	900-5800 cells/µL
15-24 months	170-7400 cells/µL
2-5 years	190-2600 cells/µL
5-10 years	200-1700 cells/µL
10-16 years	150-1500 cells/µL
>16 years	51-609 cells/µL

Interpretive Data:

Recent thymic emigrants (RTEs) $CD4^+CD45RA^+CD31^+$ represent naive T-cells recently migrated from the thymus and are measured as a percent of $CD4^+$ T-cells. A decrease or absence of RTEs is associated with a decrease or loss of thymic output in children, as seen in severe combined immunodeficiency (SCID), DiGeorge syndrome and other cellular immune deficiency disorders. RTE results should be interpreted with caution in adults due to age-related decline in thymic function. RTE assessment may also be used to evaluate immune reconstitution after hematopoietic cell transplant, post chemotherapy and in HIV patients undergoing highly active antiviral therapy (HAART). Serial measurement is recommended.

This test was developed and its performance characteristics determined by ARUP Laboratories. It has not been cleared or approved by the US Food and Drug Administration. This test was performed in a CLIA certified laboratory and is intended for clinical purposes.

Formalin Fixed Paraffin Embedded Tissue Block

Additional Information:
Complete VPLS Test Requisition. Request special requisition form No 60-002-664 if ordering on a regular basis. Package slides in durable slide holder and place with any block in padded envelope to protect from breaking.

Components:
Stained slide and control

Resulting Laboratory:
Vanderbilt Medical Laboratories

FULL VIEW

Collect:
Positively Charged Glass Microscope Slides. Do Not Use Adhesive.

Specimen Preparation:
Tissue sections cut at 4-5 microns placed in the center of the slide

Pediatric Collection:
N/A

Preferred Collection Volume:
2 unstained slides

Alternate Specimen:
Formalin Fixed Paraffin Embedded Tissue Block

Patient Preparation:
N/A

Specimen:
Unstained Tissue Slides

Reasons for Rejection:
1. Incorrect or incomplete patient identification. Label both the test requisition and the container with 2 patient identifiers. 2. Slide broken beyond repair

Components:
Stained slide and control

Stability:
Slides-Ambient: (15-25°C) indefinitely. Tissue blocks - Ambient: (15-25°C) - indefinitely.

Storage/Transport Temperature:
Slides-Ambient: (15-25°C), Tissue Blocks-Refrigerated: (2-8°C)

Synonyms:

- N/A

Performed:
Monday-Friday

Resulting Laboratory:
Vanderbilt Medical Laboratories

Turn Around Time:
2 Days

Ordering Indicators:
